(54) Title: COMPOUNDS FOR THE ANTEMORTEM DIAGNOSIS OF ALZHEIMER'S DISEASE AND IN VIVO IMAGING AND PREVENTION OF AMYLOID DEPOSITION			
(57) Abstract			
<p>Amyloid binding compounds which are derivatives of Chrysamine G, pharmaceutical compositions containing, and methods using such compounds to identify Alzheimer's brain <i>in vivo</i> and to diagnose other pathological conditions characterized by amyloidosis, such as Down's Syndrome are described. Pharmaceutical compositions containing Chrysamine G and derivatives thereof and methods using such compositions to prevent cell degeneration and amyloid-induced toxicity in amyloidosis associated conditions are also described. Methods using Chrysamine G derivatives to stain or detect amyloid deposits in biopsy or post-mortem tissue are also described. Methods using Chrysamine G derivatives to quantify amyloid deposits in homogenates of biopsy and post-mortem tissue are also described.</p>

**COMPOUNDS FOR THE ANTEMORTEM DIAGNOSIS
OF ALZHEIMER'S DISEASE AND
IN VIVO IMAGING AND PREVENTION OF AMYLOID
DEPOSITION**

The present invention was made utilizing funds from the National Institute of Ageing, grant numbers AG-05443, AG-05133 and AG-08974. This is a continuation-in-part application of U.S. patent 5 application Serial No. 08/432,019, filed May 1, 1995 which is a continuation-in-part of U.S. patent application Serial No. 08/282,289, filed July 29, 1994.

Background of the Invention

10 The present invention relates to the identification of compounds that are suitable for imaging amyloid deposits in living patients. More specifically, the present invention relates to a method of imaging amyloid deposits in brain *in vivo* to allow antemortem diagnosis of Alzheimer's Disease. The 15 present invention also relates to therapeutic uses for such compounds.

Alzheimer's Disease ("AD") is a neurodegenerative illness characterized by memory loss and other cognitive deficits. McKhann et al., *Neurology* 34: 939 20 (1984). It is the most common cause of dementia in the United States. AD can strike persons as young as 40-50 years of age, yet, because the presence of the disease is difficult to determine without dangerous brain biopsy, the time of onset is unknown. The prevalence

-2-

of AD increases with age, with estimates of the affected population reaching as high as 40-50% by ages 85-90. Evans et al., *JAMA* 262: 2551 (1989); Katzman, *Neurology* 43: 13 (1993).

5 By definition, AD is definitively diagnosed through examination of brain tissue, usually at autopsy. Khachaturian, *Arch. Neurol.* 42: 1097 (1985); McKhann et al., *Neurology* 34: 939 (1984). Neuropathologically, this disease is characterized by 10 the presence of neuritic plaques (NP), neurofibrillary tangles (NFT), and neuronal loss, along with a variety of other findings. Mann, *Mech. Ageing Dev.* 31: 213 (1985). Post-mortem slices of brain tissue of victims of Alzheimer's disease exhibit the presence of amyloid 15 in the form of proteinaceous extracellular cores of the neuritic plaques that are characteristic of AD.

The amyloid cores of these neuritic plaques are composed of a protein called the β -amyloid ($A\beta$) that is arranged in a predominately beta-pleated sheet 20 configuration. Mori et al., *Journal of Biological Chemistry* 267: 17082 (1992); Kirschner et al., *PNAS* 83: 503 (1986). Neuritic plaques are an early and invariant aspect of the disease. Mann et al., *J. Neurol. Sci.* 89: 169; Mann, *Mech. Ageing Dev.* 31: 213 25 (1985); Terry et al., *J. Neuropathol. Exp. Neurol* 46: 262 (1987).

The initial deposition of $A\beta$ probably occurs long before clinical symptoms are noticeable. The currently

-3-

recommended "minimum microscopic criteria" for the diagnosis of AD is based on the number of neuritic plaques found in brain. Khachaturian, Arch. Neurol., supra (1985). Unfortunately, assessment of neuritic plaque counts must be delayed until after death.

5 Amyloid-containing neuritic plaques are a prominent feature of selective areas of the brain in AD as well as Downs Syndrome and in persons homozygous for the apolipoprotein E4 allele who are very likely to develop AD. Corder et al., Science 261: 921 (1993);
10 Divry, P., J. Neurol. Psych. 27: 643-657 (1927);
 Wisniewski et al., in Zimmerman, H.M. (ed.): PROGRESS
 IN NEUROPATHOLOGY, (Grune and Stratton, N.Y. 1973) pp.
15 1-26. Brain amyloid is readily demonstrated by staining brain sections with thioflavin S or Congo red. Puchtler et al., J. Histochem. Cytochem. 10: 35 (1962). Congo red stained amyloid is characterized by a dichroic appearance, exhibiting a yellow-green polarization color. The dichroic binding is the result of the beta-pleated sheet structure of the amyloid proteins. Glenner, G. N. Eng. J. Med. 302: 1283 (1980). A detailed discussion of the biochemistry and histochemistry of amyloid can be found in Glenner, N. Eng. J. Med., 302: 1333 (1980).

20 25 Thus far, diagnosis of AD has been achieved mostly through clinical criteria evaluation, brain biopsies and post mortem tissue studies. Research efforts to develop methods for diagnosing Alzheimer's disease in

-4-

vivo include (1) genetic testing, (2) immunoassay methods and (3) imaging techniques.

Evidence that abnormalities in A_β metabolism are necessary and sufficient for the development of AD is based on the discovery of point mutations in the A_β precursor protein in several rare families with an autosomal dominant form of AD. Hardy, *Nature Genetics* 1: 233 (1992); Hardy et al., *Science* 256: 184 (1992). These mutations occur near the N- and C-terminal cleavage points necessary for the generation of A_β from its precursor protein. St. George-Hyslop et al., *Science* 235: 885 (1987); Kang et al., *Nature* 325: 733 (1987); Potter WO 92/17152. Genetic analysis of a large number of AD families has demonstrated, however, that AD is genetically heterogeneous. St. George-Hyslop et al., *Nature* 347: 194 (1990). Linkage to chromosome 21 markers is shown in only some families with early-onset AD and in no families with late-onset AD. More recently a gene on chromosome 14 whose product is predicted to contain multiple transmembrane domains and resembles an integral membrane protein has been identified by Sherrington et al., *Nature* 375: 754-760 (1995). This gene may account for up to 70% of early-onset autosomal dominant AD. Preliminary data suggests that this chromosome 14 mutation causes an increase in the production of A_β. Scheuner et al., *Soc. Neurosci. Abstr.* 21: 1500 (1995). A mutation on a very similar gene has been identified on chromosome 1 in Volga

-5-

German kindreds with early-onset AD. Levy-Lahad et al., *Science* 269: 973-977 (1995).

Screening for apolipoprotein E genotype has been suggested as an aid in the diagnosis of AD. Scott, 5 *Nature* 366: 502 (1993); Roses, *Ann. Neurol.* 38: 6-14 (1995). Difficulties arise with this technology, however, because the apolipoprotein E4 allele is only a risk factor for AD, not a disease marker. It is absent in many AD patients and present in many non-demented elderly people. Bird, *Ann. Neurol.* 38: 2-4 (1995).

10 Immunoassay methods have been developed for detecting the presence of neurochemical markers in AD patients and to detect an AD related amyloid protein in cerebral spinal fluid. Warner, *Anal. Chem.* 59: 1203A (1987); World Patent No. 92/17152 by Potter; Glenner et 15 al., U.S. Patent No. 4,666,829. These methods for diagnosing AD have not been proven to detect AD in all patients, particularly at early stages of the disease and are relatively invasive, requiring a spinal tap.

20 Also, attempts have been made to develop monoclonal antibodies as probes for imaging of A β . Majocha et al., *J. Nucl. Med.*, 33: 2184 (1992); Majocha et al., WO 89/06242 and Majocha et al., U.S. Patent 5,231,000. The major disadvantage of antibody probes is the 25 difficulty in getting these large molecules across the blood-brain barrier. Using antibodies for *in vivo* diagnosis of AD would require marked abnormalities in the blood-brain barrier in order to gain access into

-6-

the brain. There is no convincing functional evidence that abnormalities in the blood-brain barrier reliably exist in AD. Kalaria, *Cerebrovascular & Brain Metabolism Reviews* 4: 226 (1992).

5 A β antibodies are also disadvantageous for use in AD diagnostics because they typically stain diffuse deposits of A β in addition to the neuritic plaques - and the diffuse plaques often predominate. Yamaguchi et al., *Acta Neuropathol.*, 77: 314 (1989). Diffuse plaques may be a separate type of lesion, not necessarily involved in the dementing process of AD. The latter is suggested by findings of diffuse plaques in cognitively normal controls and aged dogs. Moran et al., *Medicina Clinica* 98: 19 (1992); Shimada et al., 15 *Journal of Veterinary Medical Science* 54: 137 (1992); Ishihara et al., *Brain Res.* 548: 196 (1991); Giaccone et al., *Neurosci. Lett.* 114: 178 (1990). Even if diffuse plaques are forerunners of neuritic plaques, the key pathological event in AD may be the process 20 that turns the apparently benign diffuse plaque into the neuritic plaque with its associated halo of degeneration. Therefore, a probe is needed that is specific for the neuritic plaque and NFTs as a more specific marker for AD pathophysiology than antibodies 25 that would also label diffuse plaques.

Recently, radiolabeled A β peptide has been used to label diffuse, compact and neuritic type plaques in sections of AD brain. Maggio et al., WO 93/04194.

-7-

However, these peptides share all of the disadvantages of antibodies. Specifically, peptides do not normally cross the blood-brain barrier in amounts necessary for imaging and because these probes react with diffuse 5 plaques, they may not be specific for AD.

Congo red may be used for diagnosing amyloidosis in vivo in non-brain parenchymal tissues. However, Congo red is probably not suitable for in vivo diagnosis of A_B deposits in brain because only 0.03% of 10 an injected dose of iodinated Congo red can enter the brain parenchyma. Tubis et al., J. Amer. Pharm. Assn. 49: 422 (1960). Radioiodinated bisdiazobenzidine compounds related to Congo red, such as Benzo Orange R and Direct Blue 4, have been proposed to be useful in 15 vitro and in vivo to detect the presence and location of amyloid deposits in an organ of a patient. Quay et al., U.S. Patent Nos. 5,039,511 and 4,933,156. However, like Congo red, all of the compounds proposed by Quay contain strongly acidic sulfonic acid groups 20 which severely limit entry of these compounds into the brain making it extremely difficult to attain an imaging effective quantity or detectable quantity in the brain parenchyma.

The inability to assess amyloid deposition in AD 25 until after death impedes the study of this devastating illness. A method of quantifying amyloid deposition before death is needed both as a diagnostic tool in mild or clinically confusing cases as well as in

- 8 -

monitoring the effectiveness of therapies targeted at preventing A β deposition. Therefore, it remains of utmost importance to develop a safe and specific method for diagnosing AD before death by imaging amyloid in
5 brain parenchyma *in vivo*. Even though various attempts have been made to diagnose AD *in vivo*, currently, there are no antemortem probes for brain amyloid. No method has utilized a high affinity probe for amyloid that has low toxicity, can cross the blood-brain barrier, and
10 binds more effectively to AD brain than to normal brain in order to identify AD amyloid deposits in brain before a patient's death. Thus, no *in vivo* method for AD diagnosis has been demonstrated to meet these criteria.

15 Very recent data suggest that amyloid-binding compounds will have therapeutic potential in AD and type 2 diabetes mellitus. As mentioned above, there are two broad categories of plaques in AD brain, diffuse and neuritic (classical). Diffuse plaques do
20 not appear to induce morphological reactions such as the reactive astrocytes, dystrophic neurites, microglia cells, synapse loss, and full complement activation found in neuritic plaques. Joachim et al., Am. J. Pathol. 135: 309 (1989); Masliah et al., loc. cit. 137: 1293 (1990); Lue and Rogers, Dementia 3: 308 (1992).
25 These morphological reactions all signify that neurotoxic and cell degenerative processes are occurring in the areas adjacent to the compact A β

-9-

deposits of neuritic plaques. A β -induced neurotoxicity and cell degeneration has been reported in a number of cell types *in vitro*. Yankner et al., *Science* 250: 279 (1990); Roher et al., *BBRC* 174: 572 (1991); Frautschy et al., *Proc. Natl. Acad. Sci.* 88: 83362 (1991); Shearman et al., *loc. cit.* 91: 1470 (1994). It has been shown that aggregation of the A β peptide is necessary for *in vitro* neurotoxicity. Yankner, *Neurobiol. Aging* 13: 615 (1992). Differences in the state of aggregation of A β in diffuse and neuritic plaques may explain the lack of neurotoxic response surrounding the diffuse plaque. Lorenzo and Yankner, *Proc. Natl. Acad. Sci.*, 91: 12243 (1994). Recently, three laboratories have reported results which suggest that Congo red inhibits A β -induced neurotoxicity and cell degeneration *in vitro*. Burgevin et al., *NeuroReport* 5: 2429 (1994); Lorenzo and Yankner, *Proc. Natl. Acad. Sci.* 91: 12243 (1994); Pollack et al., *Neuroscience Letters* 184: 113 (1995); Pollack et al., *Neuroscience Letters* 197: 211 (1995). The mechanism appears to involve both inhibition of fibril formation and prevention of the neurotoxic properties of formed fibrils. Lorenzo and Yankner, *Proc. Natl. Acad. Sci.* 91: 12243 (1994). Congo red also has been shown to protect pancreatic islet cells from the toxicity caused by amylin. Lorenzo and Yankner, *Proc. Natl. Acad. Sci.* 91: 12243 (1994). Amylin is a fibrillar peptide

-10-

similar to A β which accumulates in the pancreas in type 2 diabetes mellitus.

It is known in the art that certain azo dyes may be carcinogenic. Morgan et al. *Environmental Health Perspectives*, 102(supp.) 2: 63-78, (1994). This potential carcinogenicity appears to be based largely on the fact that azo dyes are extensively metabolized to the free parent amine by intestinal bacteria.
Cerniglia et al., *Biochem. Biophys. Res. Com.*, 107: 10 1224-1229, (1982). In the case of benzidine dyes (and many other substituted benzidines), it is the free amine which is the carcinogen. These facts have little implications for amyloid imaging studies in which an extremely minute amount of the high specific activity radiolabelled dye would be directly injected into the blood stream. In this case, the amount administered would be negligible and the dye would by-pass the intestinal bacteria.

In the case of therapeutic usage, these facts have critical importance. Release of a known carcinogen from a therapeutic compound is unacceptable. A second problem with diazo dye metabolism is that much of the administered drug is metabolized by intestinal bacteria prior to absorption. This lowered bioavailability remains a disadvantage even if the metabolites released are innocuous.

Thus, a need exists for amyloid binding compounds which are similar to Congo red but which enter the

-11-

brain (Congo Red does not). Such compounds could be used in preventing cell degeneration associated with fibril formation and thereby treat pathological conditions in amyloid associated diseases, such as AD 5 and Downs Syndrome and in treating pancreatic islet cell toxicity in type 2 diabetes mellitus.

A further need exists for amyloid binding compounds that are non-toxic and bioavailable and, consequently, can be used in therapeutics.

10

Summary of the Invention

It therefore is an object of the present invention to provide a safe, specific method for diagnosing AD before death by *in vivo* imaging of amyloid in brain parenchyma. It is another object of the present 15 invention to provide an approach for identifying AD amyloid deposits in brain before a patient's death, using a high-affinity probe for amyloid which has low toxicity, can cross the blood-brain barrier, and can distinguish AD brain from normal brain. It is another 20 object to provide a treatment for AD which will prevent the deposition or toxicity of A β . It is another object to provide a technique for staining and detecting amyloid deposits in biopsy or post-mortem tissue 25 specimens. It is another object to provide a method for quantifying amyloid deposition in homogenates of biopsy or post-mortem tissue specimens.

-12-

In accomplishing these and other objects, there has been provided, in accordance with one aspect of the present invention, an amyloid binding compound of Formula I or a water soluble, non-toxic salt thereof:

(I)

5

wherein:

$\text{Z} \text{---} \text{Z} \text{---} \text{Q}$ is either $\text{N}=\text{N}-\text{Q}$, $\text{CR}'=\text{N}-\text{Q}$, $\text{N}=\text{CR}'-\text{Q}$, $\text{CR}'_2-\text{NR}'-\text{Q}$, $\text{NR}'-\text{CR}'_2-\text{Q}$, $(\text{CO})-\text{NR}'-\text{Q}$, $\text{NR}'-(\text{CO})-\text{Q}$ or $\text{NR}'-\text{NR}'-\text{Q}$ (where R' represents H or a lower alkyl group);

10 X is $\text{C}(\text{R}'')_2$,

(wherein each R'' independently is H, F, Cl, Br, I, a lower alkyl group, $(\text{CH}_2)_n\text{OR}'$ where $n=1$, 2, or 3, CF_3 , $\text{CH}_2-\text{CH}_2\text{F}$, $\text{O}-\text{CH}_2-\text{CH}_2\text{F}$, $\text{CH}_2-\text{CH}_2-\text{CH}_2\text{F}$, $\text{O}-\text{CH}_2-\text{CH}_2-\text{CH}_2\text{F}$, CN, $(\text{C}=\text{O})-\text{R}'$, $\text{N}(\text{R}')_2$, NO_2 , $(\text{C}=\text{O})\text{N}(\text{R}')_2$,

15 $\text{O}(\text{CO})\text{R}'$, OR' , SR' , COOR' , R_{ph} , $\text{CR}'=\text{CR}'-\text{R}_{\text{ph}}$, $\text{CR}'_2-\text{CR}'_2-\text{R}_{\text{ph}}$ (where R_{ph} represents an unsubstituted or substituted phenyl group with the phenyl substituents being chosen from any of the non-

-13-

phenyl substituents defined for R''), a tri-alkyl tin, a tetrazole or oxadiazole of the form:

wherein R' is H or a lower alkyl group)

5 or X is CR'=CR', N=N, C=O, O, NR' (where R' represents H or a lower alkyl group), S, or SO₂;

each R₁ and R₂ independently is H, F, Cl, Br, I, a lower alkyl group, (CH₂)_nOR' where n=1, 2, or 3, CF₃, CH₂-CH₂F, O-CH₂-CH₂F, CH₂-CH₂-CH₂F, O-CH₂-CH₂-CH₂F, CN, 10 (C=O)-R', N(R')₂, NO₂, (C=O)N(R')₂, O(CO)R', OR', SR', COOR', a tri-alkyl tin, R_{ph}, CR'=CR'-R_{ph}, CR'₂-CR'₂-R_{ph} (where R_{ph} represents an unsubstituted or substituted phenyl group with the phenyl substituents being chosen from any of the non-phenyl substituents defined for R₁ and R₂), a tetrazole or oxadiazole of the form:

(wherein R' is H or a lower alkyl group), or a triazene of the form:

-14-

(wherein R_8 and R_9 are lower alkyl

groups) or

and at least one of R_1 is not H, OCH_3 , CH_3 , or halogen
5 when the compound of Formula I is a 1,4-diazobenzene
compound;

each Q is independently selected from one of the
following structures, each of which contains a
carboxylic acid or an acid-like functionality:
10 IA, IB, IC, ID, IE, IF and IG, wherein
IA has the following structure:

wherein:

each of R_3 , R_4 , R_5 , R_6 , or R_7 , independently is
defined the same as R_1 above and, wherein at least
one of R_3 , R_4 , R_5 , R_6 , or R_7 is a hydroxy,
sulphydryl, tetrazole, oxadiazole, NO_2 , or carboxy
15 in both Q's, and wherein at least one of R_1 , or R_2

-15-

is a halogen when the compound of Formula I is a 4,4'-diazobiphenyl compound;

IB has the following structure:

(IB)

5

or

wherein:

each of R₁₀, R₁₁, R₁₂, R₁₃, R₁₄, R₁₅, or R₁₆ independently is defined the same as R₁ above, and wherein at least one of R₁₀, R₁₁, R₁₂, R₁₃, R₁₄, R₁₅ or R₁₆ is a hydroxy, sulfhydryl, tetrazole, oxadiazole, NO₂ or carboxy in both Q's, and wherein at least one of R₁, or R₂ is a halogen when the compound of Formula I is a 4,4'-diazobiphenyl compound;

15

IC has the following structure:

(IC)

-16-

wherein:

each of R_{17} , R_{18} , R_{19} , R_{20} , or R_{21} is defined the same as R_1 above;

ID has the following structure:

5

(ID)

wherein:

each of R_{22} , R_{23} , or R_{24} independently is defined the same as R_1 above

and

10

represents a heterocyclic ring of one of the six following formulas:

-17-

IE has the following structure:

wherein:

5 each of R₂₅, R₂₆, or R₂₇, independently is defined the same as R₁ above

and

represents a heterocyclic ring of one of the six following formulas:

-18-

IF has the following structure:

wherein:

5 exactly one of R_{28} , R_{29} , R_{30} , R_{31} or R_{32} is the

link defined for Formula I above and each other
 R_{28} , R_{29} , R_{30} , R_{31} or R_{32} independently is defined the
 same as R_1 above, and wherein at least one of R_{28} ,
 R_{29} , R_{30} , R_{31} or R_{32} is a hydroxy, sulphydryl,
 10 tetrazole, oxadiazole, NO_2 or carboxy in both Q's;

-19-

IG has the following structure:

(IG)

wherein:

5 exactly one of R₃₃, R₃₄, R₃₅, R₃₆, R₃₇, R₃₈, or R₃₉ is
the $\text{Z} \bigcirc \text{Z}$ link defined for Formula I above and each
other R₃₃, R₃₄, R₃₅, R₃₆, R₃₇, R₃₈, or R₃₉ independently
is defined the same as R₁ above, and wherein at
least one of R₃₃, R₃₄, R₃₅, R₃₆, R₃₇, R₃₈, or R₃₉ is a
10 hydroxy, sulfhydryl, tetrazole, oxadiazole, NO₂ or
carboxy in both Q's;

or wherein:

$\text{Z} \bigcirc \text{Z} \bigcirc \text{Q}$ is NR'-N=Q (where R' represents H or a lower
alkyl group) and each $\text{Z} \bigcirc \text{Q}$ is independently selected
from one of the following structures:
15 IIA or IIB, wherein:

-20-

IIA has the following structure:

(IIA)

wherein:

each of R₄₀ - R₄₇, independently is H, F, Cl, Br, I,
 5 a lower alkyl group, (CH₂)_nOR' where n=1, 2, or 3,
 CF₃, CH₂-CH₂F, O-CH₂-CH₂F, CH₂-CH₂-CH₂F, O-CH₂-CH₂-
 CH₂F, CN, (C=O)-R', N(R')₂, NO₂, (C=O)N(R')₂,
 O(CO)R', OR', SR', COOR', R_{ph}, CR'=CR'-R_{ph}, CR'₂-
 10 CR'₂-R_{ph} (where R_{ph} represents an unsubstituted or
 substituted phenyl group with the phenyl
 substituents being chosen from any of the non-
 phenyl substituents defined for R₁), a tri-alkyl
 tin, a tetrazole or oxadiazole of the form:

15 (wherein R' is H or a lower alkyl group).

IIB has the following structure:

-21-

(IIB)

wherein:

each of R₄₈ and R₄₉, independently is a lower alkyl group, (CH₂)_nOR' where n=1, 2, or 3, CF₃, CH₂-CH₂F, CH₂-CH₂-CH₂F, CN, (C=O)-R', NO₂, (C=O)N(R')₂, COOR', (C=O)-(CH₂)_n-(C₆H₅) where n=1, 2, or 3, R_{ph}, CR'=CR'-R_{ph}, CR'₂-CR'₂-R_{ph} (where R_{ph} represents an unsubstituted or substituted phenyl group with the phenyl substituents being chosen from any of the non-phenyl substituents defined for R₁), a tetrazole or oxadiazole of the form:

(wherein R' is H or a lower alkyl group),

wherein at least one of R₄₈ or R₄₉ is (C=O)-R', NO₂, (C=O)N(R')₂, COOR', CN, or a tetrazole or oxadiazole of the form:

-22-

(wherein R' is H or a lower alkyl group) in both Q's.

The acid-like functionality of each Q is preferably provided by functional groups which contain 5 an ionizable proton with a pK_a of less than 10, preferably of from 2 to 9 and more preferably of from 4 to 8. The functional groups may be selected from the group consisting of hydroxy, sulfhydryl, tetrazole, oxadiazole, cyclic amide, isoindole-1,3(2H)-dione, benzisoxazole, 2,3-benzodiazine-1,4(2H,3H)-dione, 2,3-benzoxazine-1,4(3H)-dione, (2H)1,3-benzoxazine-2,4(3H)-dione, (3H)2-benzazine-1,3(2H)-dione, or NO₂.

10 The lower alkyl groups are preferably selected from the group consisting of methyl, ethyl, or straight-chain, branched, or cyclic propyl, butyl, 15 pentyl or hexyl.

One embodiment of the present invention provides 20 an amyloid binding compound of Formula I, as defined above, or a water soluble, non-toxic salt thereof, wherein at least one of the substituents R₁-R₇ and R₁₀-R₄, is selected from the group consisting of ¹³¹I, ¹²³I, ⁷⁶Br, ⁷⁵Br, ¹⁸F, ¹⁹F, ¹²⁵I, CH₂-CH₂-¹⁸F, O-CH₂-CH₂-¹⁸F, CH₂-CH₂-¹⁸F, O-CH₂-CH₂-CH₂-¹⁸F and a carbon-containing 25 substituent as specified in Formula I wherein at least one carbon is ¹¹C or ¹³C.

The invention also provides an amyloid binding compound of Formula I, as defined above, or a water-soluble, non-toxic salt thereof, wherein the compound

-23-

binds to A β with a dissociation constant (K_D) between 0.0001 and 10.0 μM when measured by binding to synthetic A β peptide or Alzheimer's Disease brain tissue.

5 Another aspect of the present invention is to provide a method for synthesizing an amyloid binding compound of Formula I, as defined above, or a water soluble, non-toxic salt thereof, wherein at least one of the substituents R₁-R, and R₁₀-R₄, is selected from 10 the group consisting of ¹³¹I, ¹²³I, ⁷⁶Br, ⁷⁵Br, ¹⁸F and ¹⁹F, comprising the step of reacting an amyloid binding compound of Formula I, as defined above, or a water soluble, non-toxic salt thereof wherein at least one of the substituents R₁-R, and R₁₀-R₄, is a tri-alkyl tin, 15 with a halogenating agent containing ¹³¹I, ¹²³I, ⁷⁶Br, ⁷⁵Br, ¹⁸F or ¹⁹F.

An additional aspect of the present invention is a pharmaceutical composition for *in vivo* imaging of amyloid deposits, comprising (a) an amyloid binding 20 compound of Formula I, as defined above, or a water soluble, non-toxic salt thereof, wherein at least one of the substituents R₁-R, and R₁₀-R₄, is selected from the group consisting of ¹³¹I, ¹²³I, ⁷⁶Br, ⁷⁵Br, ¹⁸F, ¹⁹F and a carbon-containing substituent as specified in Formula 25 I wherein at least one carbon is ¹¹C or ¹³C, and (b) a pharmaceutically acceptable carrier.

Yet another aspect of the present invention is an *in vivo* method for detecting amyloid deposits in a

-24-

subject, comprising the steps of: (a) administering a detectable quantity of the above pharmaceutical composition, and (b) detecting the binding of the compound to amyloid deposit in said subject. A related 5 aspect of the present invention provides an *in vivo* method for detecting amyloid deposits in a subject wherein the amyloid deposit is located in the brain of a subject. This method of the invention may be used in a subject who is suspected of having an amyloidosis 10 associated disease or syndrome selected from the group consisting of Alzheimer's Disease, Down's Syndrome, and homozygotes for the apolipoprotein E4 allele.

Another aspect of the invention relates to pharmaceutical compositions and methods of preventing 15 cell degeneration and toxicity associated with fibril formation in amyloidosis associated conditions such as AD and Type 2 diabetes mellitus. Such pharmaceutical compositions comprise Chrysamine G or the above described derivatives thereof and a pharmaceutically acceptable carrier. Such compounds would be non-toxic.

20 Another aspect of the invention relates to the use of the probes as a stain for the visualization and detection of amyloid deposits in biopsy or post-mortem tissue specimens.

25 Another aspect of this invention relates to the use of radiolabeled probes for the quantitation of amyloid deposits in biopsy or postmortem tissue specimens.

-25-

Another aspect relates to a method of distinguishing Alzheimer's disease brain from normal brain.

Other aspects, features and advantages of the present invention will become apparent from the following detailed description. It should be understood, however, that the detailed description and specific examples, while indicating preferred embodiments of the invention, are given by way of illustration only, since various changes and modifications within the spirit and scope of the invention will become apparent to those skilled in the art from this detailed description.

Brief Description of the Drawings

Figure 1A illustrates the chemical structures of Chrysamine G and several Chrysamine G analogues or derivatives which have been synthesized and tested, including the 3-iodo derivative (3-ICG), the 3-iodo dimethoxy derivative (3-ICG(OMe)₂), the dimethyl ester derivative (CG(COOMe)₂), the phenol derivative, salicylic acid (SA), the aniline derivative (1/2CG), Congo red, the 3,3'-diiodo derivative (3,3'-I₂CG), the 3,3'-dibromo derivative (3,3'-Br₂CG), the 3,3'-dichloro derivative (3,3'-Cl₂CG), the 3-bromo derivative (3-BrCG), and the 5-fluorosalicylic acid derivative ((5-FSA)CG). The numbers in the figure refer to each

-26-

compound's K_i (in μM) for inhibition of [^{14}C]Chrysamine G binding to the synthetic peptide, A β (10-43).

Figure 1B illustrates the chemical structures of several Chrysamine G analogues or derivatives which have been synthesized and tested, including the 3,3'-dicarboxylic acid derivative (3,3'-(COOH)₂CG), the 2,2'-disulfonic acid derivative of Chrysamine G (2,2'-(SO₃)₂CG), the 3-bromo, 3-isopropylsalicylic acid derivative (3-Br-(3-iPrSA)CG), the 3-isopropylsalicylic acid derivative ((3-iPrSA)CG), the 2,4-diphenol derivative (2,4-Diphenol), the γ -resorcylic acid derivative ((6-OHSA)CG), the 3,3',5,5'-tetramethylbenzidine derivative (3,3',5,5'-(CH₃)₄CG), the 3,3'-dimethyl derivative (3,3'-(CH₃)₂CG), the 2,2'-dimethyl derivative (2,2'-(CH₃)₂CG), the benzisoxazole derivative (CG Benzisoxazole), and the 3-carboxy alkyne derivative (3-(COOH)-C₃C). The numbers in the figure refer to each compound's K_i (in μM) for inhibition of [^{14}C]Chrysamine G binding to the synthetic peptide, A β (10-43).

Figures 2A-2K illustrate the chemical structures of Chrysamine G and tri-alkyl tin derivatives of analogues of Chrysamine G, in particular heterocyclic analogues. Note that these structures represent one-half of a molecule which is symmetric around the wavy

-27-

- bond shown in the upper right, except that the tri-alkyl tin moiety may only be on one side of the biphenyl group. The tri-alkyl tin derivatives are stable intermediate and immediate precursors for the preparation of high specific activity halogenated radioactive derivatives. The heterocyclic analogues represent alternative means of placing weakly acidic moieties in the same structural position as the moderately acidic carboxylic acid group of Chrysamine.
- G. These tri-alkyl tin precursor compounds are shown in their protonated form, yet those of skill in the art recognize that their deprotonated forms and tautomers also are embraced by these drawings.
- 2A) Chrysamine G.

5 analogue.

Figure 3 shows displacement curves of [¹⁴C]Chrysamine G binding to A_B(10-43) by several structural analogues of Chrysamine G. Abbreviations refer to those used in Figure 1. Figure 3A) Chrysamine G (open triangles); (5-FSA)CG (filled diamonds); 3,3'-(COOH)₂CG (filled squares); 2,2'-(SO₃)₂CG (filled circles). Figure 3B) Chrysamine G (open triangles); Congo red (open circles); aniline derivative (open inverted triangles); phenol derivative (open squares); salicylic acid (X's). Curves which show increased binding at higher concentrations do so because of the formation of micelles. Bedaux, F. et al., Pharm. Weekblad 98: 189 (1963).

20 Figure 4A is a Scatchard plot of Chrysamine G binding to A_B(10-43). The curved line represents a nonlinear least-squares fit to a two, independent binding site model. The straight lines represent the individual components.

25 Figure 4B is a Scatchard analysis of [¹⁴C]CG binding to typical control (diamonds) and AD brain

-29-

samples (squares). The dashed line has the same slope as the AD line and is meant to aid in the comparison with the control slope. This AD brain sample had 48 NP/x200 magnification, a K_b of 0.35 μM , and a B_{\max} of 5 790 fmol/ μg protein. The control had a K_b of 0.48 μM , and a B_{\max} of 614 fmol/ μg protein.

Figure 5 is a graph illustrating the linearity of the binding assay with respect to peptide concentration. Approximately 0.9 μg of A β (10-43) was 10 used in the typical assay.

Figure 6A is a graph illustrating the time course of association of Chrysamine G and A β (10-43).

Figure 6B is the graphic illustration of the determination of the association rate constant (k_1).

15 Figure 6C is a graph of the time course of dissociation of Chrysamine G from A β (10-43).

Figure 7 is a graphic representation of a molecular model of the interaction between Chrysamine G and A β .

20 Figure 8A is a graph illustrating the correlation between the amount of [^{14}C]Chrysamine G bound and the number of neuritic plaques (NP) in AD brain samples.

-30-

Figure 8B is a graph illustrating the correlation between the amount of [¹⁴C]Chrysamine G bound and the number of neurofibrillary tangles (NFT) in AD brain samples. In both Figure 8A and 8B, the x-axis 5 represents the average NP or NFT count per field at x200 magnification in Bielschowsky stained sections of either the superior/middle frontal (n=10) or superior temporal cortex (n=10). The filled symbols and heavy lines indicate brains without amyloid angiopathy, the 10 open symbols and dashed lines indicate brains with amyloid angiopathy. The y-axis represents total, absolute [¹⁴C]Chrysamine G binding (fmol/ μ g protein) in homogenates of brain samples adjacent to those used for staining. Approximately 75 μ g protein and 150 nM 15 [¹⁴C]Chrysamine G were used.

Figures 9A, 9B and 9C. The binding of Chrysamine G to various brain areas in samples of AD brain having more than 20 NPs/x200 magnification, referred to as "High Plaque AD Brains", is shown in figure 9A. The 20 binding of Chrysamine G to brain areas in samples of AD brain having less than 20 NPs/x200 magnification, referred to as "Low Plaque AD Brains", is shown in Figure 9B. The data points represent the ratio of [¹⁴C]Chrysamine G binding in the designated brain area 25 to [¹⁴C]Chrysamine G binding in the cerebellum (CB) of the same brain. Horizontal bars represent the mean and error bars represent the standard error for control

-31-

(circles), and AD brain (diamonds in 9A and 9B). Brain areas include the frontal pole (FP), head of caudate (CAU), superior/ middle frontal (SMF), superior temporal (ST), inferior parietal (IP), and occipital (OC) cortex. Asterisks indicate significant differences compared to control (* $p<0.05$; ** $p<0.001$). Two Down's syndrome brain samples are indicated in Figure 9C. The diamonds in 9C represent a brain from a 23 year old Down's syndrome patient not yet symptomatic with AD. The triangles in 9C represent a 51 year old Down's syndrome patient who had developed AD as do the vast majority of Down's syndrome patients by their 40's.

Figure 10 is a graph illustrating the tissue levels of Chrysamine G in mice injected with [^{14}C]Chrysamine G in the lateral tail vein and sacrificed at the times indicated. The open symbols and thin lines represent absolute radioactivity in units of cpm/g tissue (left axis). The closed symbols and solid lines represent the ratio of brain radioactivity to that in kidney (top) or blood (middle). The ratios are plotted on the right axis.

Figure 11. TOP: Section from the inferior temporal lobe of AD brain stained with Chrysamine G by the method of Stokes and Trickey, J. Clin. Pathol. 26: 241-242 (1973). Two neuritic plaques are clearly

-32-

visible. BOTTOM: Adjacent sections from the temporal lobe of an AD patient with amyloid angiopathy. Left: Brain section was stained with the Congo red method of Puchtler. Puchtler et al., *J. Histochem. Cytochem.* 10: 5 35 (1962). The bar represents 20 microns. Right: Adjacent brain section stained by substituting Chrysamine G for Congo red in the Puchtler method. Both sections readily demonstrate the same amyloid-laden vessel. A small amount of background 10 autofluorescence from erythrocytes and lipofuscin also is visible. All photomicrographs were obtained using fluorescein isothiocyanate (FITC) filters.

Figure 12. A bar graph showing the effect of increasing concentrations of A β (25-35) in the presence 15 and absence of Chrysamine G on the cellular redox activity of rat pheochromocytoma (PC-12) cells as measured by 3-[4,5-dimethylthiazol-2-yl]-2,5-diphenyltetrazolium bromide, MTT, reduction. The reduction product of MTT absorbs at 560 nm which is plotted on the vertical axis. The effect of A β (25-35) alone is shown in the filled bars and shows a dose 20 dependent decrease in MTT reduction. Significant differences from control (no A β (25-35), no Chrysamine G) are shown in white inside the filled bars. The protective effect of 20 μ M Chrysamine G is shown in the 25 open bars. Significant differences between MTT

-33-

reduction in the presence and absence of Chrysamine G are shown in black inside the open bars.

Figure 13. A bar graph showing the protective effect of increasing concentrations of Chrysamine G against the A β (25-35)-induced reduction of cellular redox activity of rat pheochromocytoma (PC-12) cells as measured by 3-[4,5-dimethylthiazol-2-yl]-2,5-diphenyltetrazolium bromide, MTT, reduction. The reduction product of MTT absorbs at 560 nm which is plotted on the vertical axis. The effect of Chrysamine G in the absence of A β (25-35) is shown in the filled bars. There was no significant difference between control (no A β (25-35), no Chrysamine G) and any of the concentrations of Chrysamine G in the absence of A β (25-35). MTT reduction in the presence of 1 μ M A β (25-35) and increasing concentrations of Chrysamine G is shown in the open bars. Significant differences in MTT reduction between the presence and absence of A β (25-35) at each concentration of Chrysamine G are shown in white inside the filled bars. Significant differences in MTT reduction between the A β (25-35) control (no Chrysamine G) and A β (25-35) plus increasing concentrations of Chrysamine G are shown in black inside the open bars.

Figure 14. Comparison of the effects of Chrysamine-G and the inactive phenol derivative on the

-34-

toxicity induced by A β (25-35). 1 μ M A β (25-35) was present in all experiments except control. Chrysamine-G showed protective effects at 0.1 and 1 μ M, but the phenol derivative showed no protective effects, and perhaps enhanced the toxicity of A β .

Detailed Description of the Preferred Embodiments

The present invention exploits the ability of Chrysamine G and radiolabeled derivatives thereof to cross the blood brain barrier *in vivo* and bind to A β deposited in neuritic (but not diffuse) plaques, to A β deposited in cerebrovascular amyloid, and to the amyloid consisting of the protein deposited in NFT. Chrysamine G is a Congo red derivative with the key structural difference being that the sulfonic acid moieties found in Congo red are replaced by carboxylic acid groups in Chrysamine G (Figure 1). This structural alteration allows Chrysamine G to enter the brain better than Congo red and large macromolecules such as antibodies. Tubis et al., *J. Am. Pharmaceut. Assn.* 49: 422 (1960). Also, Chrysamine G may be a more specific marker for AD pathophysiology than antibodies, which would also label diffuse plaques, due to the apparent specificity of Chrysamine G for the neuritic plaque and NFTs.

The Chrysamine G derivatives of the present invention have each of the following characteristics:
(1) specific binding to synthetic A β *in vitro*, (2)

-35-

binding to neuritic but not diffuse plaques in brain sections (3) ability to cross a non-compromised blood brain barrier *in vivo*.

The method of this invention determines the presence and location of amyloid deposits in an organ or body area, preferably brain, of a patient. The present method comprises administration of a detectable quantity of a pharmaceutical composition containing a compound of Formula I, as defined above, called a "detectable compound," or a pharmaceutically acceptable water-soluble salt thereof, to a patient. A "detectable quantity" means that the amount of the detectable compound that is administered is sufficient to enable detection of binding of the compound to amyloid. An "imaging effective quantity" means that the amount of the detectable compound that is administered is sufficient to enable imaging of binding of the compound to amyloid.

The invention employs amyloid probes which, in conjunction with non-invasive neuroimaging techniques such as magnetic resonance spectroscopy (MRS) or imaging (MRI), or gamma imaging such as positron emission tomography (PET) or single-photon emission computed tomography (SPECT), are used to quantify amyloid deposition *in vivo*. The term "in vivo imaging" refers to any method which permits the detection of a labeled Chrysamine G, labeled Chrysamine G derivative or labeled compound of Formula I, as

-36-

described above, of the present invention. For gamma imaging, the radiation emitted from the organ or area being examined is measured and expressed either as total binding or as a ratio in which total binding in 5 one tissue is normalized to (for example, divided by) the total binding in another tissue of the same subject during the same *in vivo* imaging procedure. Total binding *in vivo* is defined as the entire signal detected in a tissue by an *in vivo* imaging technique 10 without the need for correction by a second injection of an identical quantity of labeled compound along with a large excess of unlabeled, but otherwise chemically identical compound. A "subject" is a mammal, preferably a human, and most preferably a human 15 suspected of having dementia.

For purposes of *in vivo* imaging, the type of detection instrument available is a major factor in selecting a given label. For instance, radioactive isotopes and ^{19}F are particularly suitable for *in vivo* imaging in the methods of the present invention. The 20 type of instrument used will guide the selection of the radionuclide or stable isotope. For instance, the radionuclide chosen must have a type of decay detectable by a given type of instrument. Another 25 consideration relates to the half-life of the radionuclide. The half-life should be long enough so that it is still detectable at the time of maximum uptake by the target, but short enough so that the host

-37-

does not sustain deleterious radiation. The radiolabeled compounds of the invention can be detected using gamma imaging wherein emitted gamma irradiation of the appropriate wavelength is detected. Methods of 5 gamma imaging include, but are not limited to, SPECT and PET. Preferably, for SPECT detection, the chosen radiolabel will lack a particulate emission, but will produce a large number of photons in a 140-200 keV range. For PET detection, the radiolabel will be a 10 positron-emitting radionuclide such as ¹⁸F which will annihilate to form two 511 keV gamma rays which will be detected by the PET camera.

In the present invention, amyloid binding compounds/probes are made which are useful for *in vivo* 15 imaging and quantification of amyloid deposition. These compounds are to be used in conjunction with non-invasive neuroimaging techniques such as magnetic resonance spectroscopy (MRS) or imaging (MRI), positron emission tomography (PET), and single-photon emission 20 computed tomography (SPECT). In accordance with this invention, the Chrysamine G derivatives may be labeled with ¹⁸F or ¹³C for MRS/MRI by general organic chemistry techniques known to the art. See, e.g., March, J. "ADVANCED ORGANIC CHEMISTRY: REACTIONS, MECHANISMS, AND 25 STRUCTURE (3rd Edition, 1985), the contents of which are hereby incorporated by reference. The Chrysamine G derivatives also may be radiolabeled with ¹⁸F, ¹¹C, ⁷⁵Br, or ⁷⁶Br for PET by techniques well known in the art and

-38-

are described by Fowler, J. and Wolf, A. in POSITRON EMISSION TOMOGRAPHY AND AUTORADIOGRAPHY (Phelps, M., Mazziota, J., and Schelbert, H. eds.) 391-450 (Raven Press, NY 1986) the contents of which are hereby
5 incorporated by reference. The Chrysamine G derivatives also may be radiolabeled with ^{123}I for SPECT by any of several techniques known to the art. See, e.g., Kulkarni, *Int. J. Rad. Appl. & Inst.* (Part B) 18: 647 (1991), the contents of which are hereby
10 incorporated by reference. In addition, the Chrysamine G derivatives may be labeled with any suitable radioactive iodine isotope, such as, but not limited to ^{131}I , ^{125}I , or ^{123}I , by iodination of a diazotized amino derivative directly via a diazonium iodide, see
15 Greenbaum, F. *Am. J. Pharm.* 108: 17 (1936), or by conversion of the unstable diazotized amine to the stable triazene, or by conversion of a non-radioactive halogenated precursor to a stable tri-alkyl tin derivative which then can be converted to the iodo compound by several methods well known to the art.
20 See, Satyamurthy and Barrio *J. Org. Chem.* 48: 4394 (1983), Goodman et al., *J. Org. Chem.* 49: 2322 (1984), and Mathis et al., *J. Labell. Comp. and Radiopharm.* 1994: 905; Chumpradit et al., *J. Med. Chem.* 34: 877 (1991); Zhuang et al., *J. Med. Chem.* 37: 1406 (1994);
25 Chumpradit et al., *J. Med. Chem.* 37: 4245 (1994). For example, a stable triazene or tri-alkyl tin derivative of Chrysamine G or its analogues is reacted with a

halogenating agent containing ^{131}I , ^{125}I , ^{123}I , ^{76}Br , ^{75}Br ,
18F or 19F. Thus, the stable tri-alkyl tin derivatives
of Chrysamine G and its analogues are novel precursors
useful for the synthesis of many of the radiolabeled
5 compounds within the present invention. As such, these
tri-alkyl tin derivatives are one embodiment of this
invention.

The Chrysamine G derivatives also may be
radiolabeled with known metal radiolabels, such as
10 Technetium-99m ($^{99\text{m}}\text{Tc}$). Modification of the
substituents to introduce ligands that bind such metal
ions can be effected without undue experimentation by
one of ordinary skill in the radiolabeling art. The
metal radiolabeled Chrysamine G derivative can then be
15 used to detect amyloid deposits.

The methods of the present invention may use
isotopes detectable by nuclear magnetic resonance
spectroscopy for purposes of *in vivo* imaging and
spectroscopy. Elements particularly useful in magnetic
resonance spectroscopy include ^{19}F and ^{13}C .
20

Suitable radioisotopes for purposes of this
invention include beta-emitters, gamma-emitters,
positron-emitters, and x-ray emitters. These
radioisotopes include ^{131}I , ^{123}I , ^{18}F , ^{11}C , ^{75}Br , and ^{76}Br .
25 Suitable stable isotopes for use in Magnetic Resonance
Imaging (MRI) or Spectroscopy (MRS), according to this
invention, include ^{19}F and ^{13}C . Suitable radioisotopes
for *in vitro* quantification of amyloid in homogenates

-40-

of biopsy or post-mortem tissue include ^{125}I , ^{14}C , and ^3H . The preferred radiolabels are ^{18}F for use in PET *in vivo* imaging, ^{123}I for use in SPECT imaging, ^{19}F for MRS/MRI, and ^3H or ^{14}C for *in vitro* studies. However, 5 any conventional method for visualizing diagnostic probes can be utilized in accordance with this invention.

The method could be used to diagnose AD in mild or clinically confusing cases. This technique would also 10 allow longitudinal studies of amyloid deposition in human populations at high risk for amyloid deposition such as Down's syndrome, familial AD, and homozygotes for the apolipoprotein E4 allele. Corder et al., *Science* 261: 921 (1993). A method that allows the 15 temporal sequence of amyloid deposition to be followed can determine if deposition occurs long before dementia begins or if deposition is unrelated to dementia. This method can be used to monitor the effectiveness of therapies targeted at preventing amyloid deposition.

20

Generally, the dosage of the detectably labeled Chrysamine G derivative will vary depending on considerations such as age, condition, sex, and extent 25 of disease in the patient, contraindications, if any, concomitant therapies and other variables, to be adjusted by a physician skilled in the art. Dosage can vary from 0.001 mg/kg to 1000 mg/kg, preferably 0.1 mg/kg to 100 mg/kg.

-41-

Administration to the subject may be local or systemic and accomplished intravenously, intraarterially, intrathecally (via the spinal fluid) or the like. Administration may also be intradermal or intracavitory, depending upon the body site under examination. After a sufficient time has elapsed for the compound to bind with the amyloid, for example 30 minutes to 48 hours, the area of the subject under investigation is examined by routine imaging techniques such as MRS/MRI, SPECT, planar scintillation imaging, PET, and emerging imaging techniques, as well. The exact protocol will necessarily vary depending upon factors specific to the patient, as noted above, and depending upon the body site under examination, method of administration and type of label used; the determination of specific procedures would be routine to the skilled artisan. For brain imaging, preferably, the amount (total or specific binding) of the bound radioactively labelled Chrysamine G or Chrysamine G derivative or analogue is measured and compared (as a ratio) with the amount of labelled Chrysamine G or Chrysamine G derivative bound to the cerebellum of the patient. This ratio is then compared to the same ratio in age-matched normal brain.

The pharmaceutical compositions of the present invention are advantageously administered in the form of injectable compositions. A typical composition for such purpose comprises a pharmaceutically acceptable

-42-

carrier. For instance, the composition may contain about 10 mg of human serum albumin and from about 0.5 to 500 micrograms of the labeled Chrysamine G or Chrysamine G derivative per milliliter of phosphate buffer containing NaCl. Other pharmaceutically acceptable carriers include aqueous solutions, non-toxic excipients, including salts, preservatives, buffers and the like, as described, for instance, in REMINGTON'S PHARMACEUTICAL SCIENCES, 15th Ed. Easton: 5 Mack Publishing Co. pp. 1405-1412 and 1461-1487 (1975) and THE NATIONAL FORMULARY XIV., 14th Ed. Washington: American Pharmaceutical Association (1975), the contents of which are hereby incorporated by reference.

10

Examples of non-aqueous solvents are propylene glycol, polyethylene glycol, vegetable oil and injectable organic esters such as ethyl oleate. Aqueous carriers include water, alcoholic/aqueous solutions, saline solutions, parenteral vehicles such as sodium chloride, Ringer's dextrose, etc.

15

Intravenous vehicles include fluid and nutrient replenishers. Preservatives include antimicrobials, anti-oxidants, chelating agents and inert gases. The pH and exact concentration of the various components of the pharmaceutical composition are adjusted according

20

to routine skills in the art. See, Goodman and Gilman's THE PHARMACOLOGICAL BASIS FOR THERAPEUTICS

25

(7th Ed.).

-43-

Particularly preferred pharmaceutical compositions of the present invention are those that, in addition to specifically binding amyloid *in vivo* and capable of crossing the blood brain barrier, are also non-toxic at appropriate dosage levels and have a satisfactory duration of effect.

Molecular Modeling

Molecular modeling was done on an Evans and Sutherland PS-330 computer graphics system, running the computer modeling program MacroModel (Version 2.5 available from C. Still at Columbia University) to generate the A β peptide chains in the anti-parallel beta-sheet conformation. Kirschner et al., Proc. Natl. Acad. Sci. U.S.A. 83: 503 (1986). The amyloid peptides were used without further structural refinement. The A β peptides were aligned so that alternate chains were spaced 4.76 Å apart, characteristic of beta-sheet fibrils. Kirschner, *supra*. Chrysamine G was energy minimized and aligned with the fibril model to maximize contact with lysine-16 of A β (10-43) and the hydrophobic phenylalanine-19 and -20 region.

Characterization of Specific Binding to A β Synthetic Peptide: Affinity, Kinetics, Maximum Binding

The characteristics of Chrysamine G and Chrysamine G derivative binding are first analyzed

-44-

using synthetic A β peptide called A β (10-43). The 10-43 peptide was chosen because it has been shown that this peptide provides a model system containing all of the characteristic structural features of A β peptides.

5 Hilbich et al., J. Mol. Biol. 218: 149 (1991). The 10-43 amino acid fragment of A β was synthesized with 9-fluorenylmethyl chloroformate (FMOC) chemistry by the Peptide Synthesis Facility of the University of Pittsburgh. The peptide was characterized by mass spectrometry and the major component had an M_r of 3600 g/mole (calc. 3598). The peptide was further purified by the method of Hilbich et al. which, in brief, consisted of sequential size-exclusion chromatography on a Biogel P10 column (2 x 180 cm, 200-400 mesh,

10 Biorad, Richmond, CA) in 70% formic acid followed by a second elution through a Biogel P4 column (2 x 180 cm, 200-400 mesh) in 1M acetic acid. Hilbich et al., J. Mol. Biol. 218: 149 (1991). The peptide was lyophilized and stored at -80°C until used in the

15 binding assays.

20

Amino acid sequence for A β (10-43) is as follows:

10	11	12	13	14	15	16	17	18	19	20	21
Tyr	Glu	Val	His	His	Gln	Lys	Leu	Val	Phe	Phe	Ala
22	23	24	25	26	27	28	29	30	31	32	33

-45-

Glu	Asp	Val	Gly	Ser	Asn	Lys	Gly	Ala	Ile	Ile	Gly
34	35	36	37	38	39	40	41	42	43		
Leu	Met	Val	Gly	Gly	Val	Val	Ile	Ala	Thr		

Binding assay to synthetic A_B(10-43)

5 Binding assays were performed in 12 x 75 mm
 borosilicate glass tubes. Various concentrations of
 nonradioactive Chrysamine G derivatives were added in
 10% ethanol/water. Ethanol was necessary to prevent
 the micelle formation which occurs with these diazo dye
 10 derivatives, since the micelles are trapped by the
 filter even in the absence of peptide. To the above
 solution, 25 µl of a 0.36 mg/ml suspension of A_B(10-43)
 in H₂O was added and 10% ethanol was added to bring the
 volume to 950 µl. After incubating for 10 min at room
 15 temperature, 50 µl of [¹⁴C]Chrysamine G in 40% ethanol
 was added, resulting in a final concentration of
 [¹⁴C]Chrysamine G of 100-125 nM depending on the
 preparation of [¹⁴C]Chrysamine G used. The binding
 mixture was incubated for 30 min at room temperature.
 20 Bound and free radioactivity were separated by vacuum
 filtration through Whatman GF/B filters using a Brandel
 M-24R Cell Harvester (Gaithersburg, MD) followed by two
 3-ml washes with 10% ethanol at room temperature.
 Filters were equilibrated overnight in 4 ml Cytoscint®-
 25 ES scintillant (ICN Biomedicals, Inc., Irvine, CA) in

-46-

7.0 ml plastic scintillation vials before counting. In this and all binding assays, incubations were done at least in triplicate and the results expressed as mean ± standard deviation.

5 **Kinetic studies**

Kinetics studies of [¹⁴C]Chrysamine G binding to A_β(10-43) were performed in 13 x 100 mm borosilicate glass tubes by the filtration assay described above. For the kinetics of association, 25 µl of 0.36 mg/ml A_β(10-43) were placed in 475 µl of 10% ethanol and 4.5 ml of 125 nM [¹⁴C]Chrysamine G was added to the solution at time zero. The mixture was rapidly vortexed and the binding reaction was stopped by vacuum filtration through Whatman GF/B filters using a Brandel 10 M-24R Cell Harvester (Gaithersburg, MD) followed by two 15 3-ml washes with 10% ethanol at room temperature at times of 5, 10, 20, 30, 45, 60, 75, 135, 240, and 300 sec.; bound radioactivity was determined as above.

For the kinetics of dissociation, 25 µl of 0.36 mg/ml A_β(10-43) were placed in 450 µl of 10% ethanol followed by 25 µl of 2.5 µM [¹⁴C]Chrysamine G in 40% ethanol. This mixture was vortexed and incubated for 30 min at room temperature. The mixture was diluted with 4.5 ml of 10 µM nonradioactive Chrysamine G in 10% ethanol at time zero, the mixture was rapidly vortexed, 20 and the dissociation was stopped by filtration as above

-47-

at times of 0.5, 1.5, 3, 5, and 15 min, and bound radioactivity was determined as above.

Characterization of Specific Binding to Alzheimer's Disease Brain

5 Binding of Chrysamine G to AD and control brain homogenates

Autopsy brain samples were obtained from the Neuropathology Core of the Alzheimer's Disease Research Center of the University of Pittsburgh. Controls were defined as not meeting neuropathological criteria for AD (sufficient number of NPs or NFTs) according to the standards specified in a published NIA conference report. Khachaturian, Arch. Neurol. 42: 1097 (1985). Brain samples from eight control (ages 58-75), eleven AD (ages 61-84), and two Down syndrome brains (ages 23 and 51) were studied. There were six high-plaque (>20 NPs/x200 magnification) and five low-plaque (<20 NPs/x200 magnification) AD brains. Two controls were clinically demented but had no NPs or NFTs and received the diagnosis of "Dementia Lacking Distinctive Histology". Knopman Dementia 4: 132 (1993). Another control had dementia and olivopontocerebellar atrophy. The other controls had no clinical or histological evidence of neurologic disease. Autopsy samples were immediately frozen at -70 °C and stored at that temperature until homogenized. The numbers of NPs and NFTs were counted in sections of five separate but

-48-

adjacent fields (x200 magnification) between cortical layers 2 and 4 in the cortex at the junction of superior and middle frontal gyri and superior temporal isocortex of all brains studied. A qualitative 5 assessment of the presence of amyloid angiopathy in the superior/middle frontal cortex was made. The Bielschowsky silver impregnation method was used to identify NPs and NFTs and Congo red staining was used to identify cerebral amyloid angiopathy. Details of 10 this procedure have been previously published. Moossey et al., Arch. Neurol. 45: 251 (1988). Samples used for CG binding to the superior/middle frontal or superior temporal cortex were adjacent on gross dissection to those used for NP and NFT counts.

15 Approximately 100 mg of tissue from the junction of the superior and middle frontal cortex, superior temporal cortex, frontal pole, head of the caudate, inferior parietal cortex, occipital cortex, or cerebellum were homogenized with a Polytron® tissue 20 homogenizer (PT 10/35, Brinkman Instruments Inc., Westbury, NY) for 30 sec at setting 6 in 10% ethanol at a concentration of 10-20 mg brain/ml. Not all areas were available from each brain. Aliquots of 25-150 µl tissue (about 25-300 µg of protein by the method of 25 Lowry et al., J. Biol. Chem. 193: 265 (1951)) were incubated in 12 x 75 mm borosilicate glass tubes at room temperature with 10-750 nM [¹⁴C]CG (26.8 Ci/mole) in a final volume of 1.0 ml of 10% ethanol for 30 min

-49-

at room temperature. The standard conditions employed about 150 μ g of protein and 75 nM [14 C]CG for the cerebellar ratio studies and about 75 μ g of protein and 150 nM [14 C]CG for the correlative studies with NPs, 5 NFTs, and amyloid angiopathy. Ethanol was necessary to prevent the micelle formation which occurs with diazo dye derivatives, since the micelles are trapped by the filter even in the absence of tissue. Bound and free radioactivity were separated by vacuum filtration 10 through Whatman GF/B filters using a Brandel M-24R Cell Harvester (Gaithersburg, MD) followed by two 3-ml washes with 10% ethanol at room temperature. Filters were equilibrated overnight in 4 ml Cytoscint[®]-ES 15 scintillant (ICN Biomedicals, Inc., Irvine, CA) in 7.0 ml plastic scintillation vials before counting.

Saturable (specific) binding was defined as total binding minus residual (non-saturable) binding in the presence of 20 μ M unlabelled CG. In all binding assays, incubations were done at least in triplicate 20 and the results expressed as mean \pm standard error unless otherwise specified. Results were expressed either in absolute terms of fmol [14 C]CG bound/ μ g protein in a given brain area, or as a ratio of the fmol/ μ g protein in that brain area to the fmol/ μ g 25 protein in the cerebellum of the same brain.

-50-

Octanol/Water Partitioning

Approximately 75 μ M solutions of Chrysamine G or its analogues were prepared in 5.0 ml 1-octanol. Five ml of phosphate buffered saline (0.15 M NaCl, 5 mM potassium phosphate, pH 7.4) were added and the layers mixed by rapid vortexing. The mixture was then centrifuged at 1,000 g to facilitate the formation of two clear phases. The layers were separated using a separatory funnel and 600 μ l of each layer was diluted with 400 μ l of ethanol and the absorbance measured at 389 nm for Chrysamine G or the λ_{max} for each analogue. Concentrations were determined after correction for the molar absorptivity differences in the two solvents and the partition coefficient expressed as the concentration in the octanol layer divided by the concentration in the aqueous layer. Experiments were done in triplicate.

Imaging the Binding of Chrysamine G to Amyloid Deposits in Alzheimer's Disease Brain

For visual demonstration of CG binding to tissue, adjacent 8 micron paraffin sections of an AD brain with heavy deposits of cerebrovascular amyloid were stained with both CG and Congo red by the alkaline Congo red method of Puchtler et al., *J. Histochem. Cytochem.* 10: 355 (1962) or the method of Stokes and Trickey, *J. Clin. Pathol.* 26: 241-242 (1973). In the CG staining procedure, CG was substituted for Congo red, but the

-51-

procedure was otherwise identical. Stained slides were examined using a fluorescein isothiocyanate (FITC) filter.

5 **Determining Compound's Ability to Cross
the Blood Brain Barrier**

10 Mouse studies Female Swiss-Webster mice were injected in the lateral tail vein with approximately 0.03 μ Ci/g of [14 C]Chrysamine G in a 0.9% NaCl solution. Mice were sacrificed by cervical dislocation at intervals of 15 min, 35 min, 1 hr, 4 hr, and 24 hr after injection. The carotid blood, brain, liver, and kidneys were rapidly obtained, weighed, and homogenized in distilled/deionized H₂O using a ground glass homogenizer. An aliquot was weighed into an 18.0 ml plastic scintillation vial (Beckman Poly-Q-Vial) and counted after addition of 10.0 ml of scintillation cocktail (Cytoscint®-ES (ICN)) and overnight equilibration. The [14 C]Chrysamine G content of the tissues was expressed as cpm/mg tissue.

20 Experiments in which radioactivity was extracted from tissues were performed as above except 0.05 μ Ci/g of [14 C]Chrysamine G was injected and the mice were sacrificed at 60 min. Brain and liver were then removed and extracted with a Folch procedure. Folch et al., J. Biol. Chem. 226: 447 (1957). In both tissues, over 95% of the extracted radioactivity was contained in the organic layer. The organic layer was evaporated

-52-

to dryness, resuspended in a minimal amount of 10% methanol/90% ACN, and injected onto a silica column (Prep Nova Pak HR Silica, 7.8 x 300 mm, Waters, Milford, MA) and eluted isocratically with the same solvent. Under these conditions, 99% of the radioactivity is eluted in the solvent front, but most lipids are retained longer, making the fraction eluting in the solvent front suitable for injection onto the reverse-phase C4 column system described above. The entire solvent front was collected, dried, and resuspended in 10% ACN/90% sodium phosphate buffer (5mM, pH 6) and injected, along with authentic non-radioactive Chrysamine G, onto the C4 column. One minute fractions were collected and counted after addition of 10 ml of Cytoscint[®]-ES.

In yet another embodiment, the invention relates to a pharmaceutical composition and method for preventing cell degeneration and toxicity associated with fibril formation in certain "amyloidosis associated" conditions such as Alzheimer's Disease, Down's Syndrome and Type 2 diabetes mellitus, hereditary cerebral hemorrhage amyloidosis (Dutch), amyloid A (reactive), secondary amyloidosis, familial mediterranean fever, familial amyloid nephropathy with urticaria and deafness (Muckle-wells Syndrome), amyloid lambda L-chain or amyloid kappa L-chain (idiopathic, myeloma or macroglobulinemia-associated) A beta 2M (chronic hemodialysis), ATTR (familial amyloid

-53-

polyneuropathy (Portuguese, Japanese, Swedish),
familial amyloid cardiomyopathy (Danish), isolated
cardiac amyloid, (systemic senile amyloidoses), AIAPP
or amylin insulinoma, atrial natriuretic factor (isolated
5 atrial amyloid), procalcitonin (medullary carcinoma of
the thyroid), gelsolin (familial amyloidosis
(Finnish)), cystatin C (hereditary cerebral hemorrhage
with amyloidosis (Icelandic)), AApo-A-I (familial
amyloidotic polyneuropathy - Iowa), AApo-A-II
10 (accelerated senescence in mice), fibrinogen-associated
amyloid; and Asor or Pr P-27 (scrapie, Creutzfeld Jacob
disease, Gertsmann-Straussler-Scheinker syndrome,
bovine spongiform encephalitis) or in cases of persons
who are homozygous for the apolipoprotein E4 allele.
15 This method involves administering a pharmaceutical
composition comprising Chrysamine G, or one of the
above described derivatives thereof, to a subject
suspected of having or at high risk of developing such
amyloidosis associated condition.
20 Because certain diazo compounds could be
carcinogenic, the therapeutic compounds of the present
invention include only non-toxic, non-carcinogenic
compounds. That is, the present invention addresses
the problems with potential carcinogenicity by using
25 only diazo compounds based on 3,3',5,5'-
tetramethylbenzidine. 3,3',5,5'-Tetramethylbenzidine
is a well-studied non-mutagenic, non-carcinogenic
substitute for benzidine. Holland et al.. Tetrahedron,

-54-

30: 3299-3302, (1974). De Serres and Ashby (eds.)
Evaluation of Short-Term Tests for Carcinogens,
Elsevier North-Holland, 1981. 3,3',5,5'-
Tetramethylbenzidine has been used as a substitute for
5 benzidine in the synthesis of azo dyes. Josephy and
Weerasooriya, *Chem.-Biol. Interactions*, 1984: 375-382,
(1984). Ashby et al., *Carcinogenesis* 3: 1277-1282,
(1982). Inventors have synthesized the tetramethyl
analog of Chrysamine G (4,4'-bis(3-carboxy-4-
10 hydroxyphenylazo)-3,3',5,5'-tetramethylbiphenyl) and
have shown it to bind to synthetic A β (10-43) with a Ki
of $0.75 \pm .09 \mu\text{M}$, a value about twice that of
Chrysamine G.

Any potential problems with lower bioavailability
15 is avoided by the use of alkenyl and alkynyl
derivatives of the azo compounds. These compounds are
not substrates for reduction by bacterial or mammalian
azo reductases.

Indeed, compounds of the present invention
20 intended for therapeutic use are advantageous over
existing compounds because they contain either a non-
mutagenic, non-carcinogenic benzidine derivative or an
alkenyl or alkynyl linkage which is not a substrate for
bacterial azo-reductases in the intestines.

25 In vitro studies have shown that A β neurotoxicity
requires fibril formation and is inhibited by Congo
red. Specifically, it has been shown that the amyloid

-55-

fibril-binding dye Congo red inhibits fibrillar A β neurotoxicity by inhibiting fibril formation or by binding preformed fibrils. Lorenzo et al., Proc. Natl. Acad. Sci. USA 91: 12243-12247 (1994). Congo red also 5 has been shown to inhibit pancreatic islet cell toxicity of diabetes-associated amylin, another type of amyloid fibril. Lorenzo et al., supra. See also, Burgevin et al. NeuroReport 5: 2429 (1994); Pollack et al., J. Neurosci. Letters 184: 113-116 (1995); Pollack 10 et al. Neuroscience Letters 197: 211 (1995). These data indicate that amyloid-binding compounds such as Chrysamine G and its derivatives, which are similar to Congo red but which, unlike Congo red, enter the brain well, would be effective in preventing cell 15 degeneration and toxicity associated with fibril formation in amyloidosis associated conditions.

In Example 8 and Figures 12 and 13, it is shown that Chrysamine G has effects very similar to those previously reported for Congo red in having a dose-dependent, protective effect in rat pheochromocytoma. 20 Therefore, these in vitro assays provide a means for selecting compounds for use in pharmaceutical compositions for the prevention of cell degeneration and toxicity associated with fibril formation.

25 Compounds such as Chrysamine G and the above described derivatives thereof, are tested pursuant to the present invention, for in vivo efficacy in preventing amyloid fibril formation or associated

cellular degeneration, as measured by the formation of dystrophic neurites, synapse loss, neurofibrillary tangle formation and gliosis, in an animal model, such as the "senile animal" model for cerebral amyloidosis,
5 Wisniewski et al., *J. Neuropathol. & Exp. Neurol.* 32: 566 (1973), the mouse model of familial Mediterranean fever (Neurochem., Inc. Kingston, Ontario, Canada) and the transgenic mouse model of Alzheimer-type neuropathology, Games et al., *Nature* 373: 523-527
10 (1995). In the familial Mediterranean fever model, the animals develop systemic amyloidosis. In an in vivo assay according to this invention, serial necropsies in animals treated and untreated with the compounds of the present invention to evaluate the inhibition of amyloid formation are compared. In the animal models for cerebral amyloid formation, in addition to following amyloid formation serially, the presence of amyloid-associated neurodegeneration, as measured by the formation of dystrophic neurites, synapse loss,
15 neurofibrillary tangle formation and gliosis, also is assessed in serial necropsies in animals treated and untreated with the compounds of the present invention.
20

According to the present invention, a pharmaceutical composition comprising Chrysamine G or derivatives thereof, is administered to subjects in whom amyloid or amyloid fibril formation, cell degeneration and toxicity are anticipated. In the preferred embodiment, such subject is a human and
25

-57-

includes, for instance, those who are at risk of developing cerebral amyloid, including the elderly, nondemented population and patients having amyloidosis associated diseases and Type 2 diabetes mellitus. The 5 term "preventing" is intended to include the amelioration of cell degeneration and toxicity associated with fibril formation. By "amelioration" is meant the prevention of more severe forms of cell degeneration and toxicity in patients already 10 manifesting signs of toxicity, such as dementia.

The pharmaceutical composition for purposes of preventing cell degeneration and toxicity associated with fibril formation in amyloidosis associated diseases comprises Chrysamine G or a derivative thereof 15 described above and a pharmaceutically acceptable carrier. In one embodiment, such pharmaceutical composition comprises serum albumin, Chrysamine G or Chrysamine G derivative and a phosphate buffer containing NaCl. Other pharmaceutically acceptable 20 carriers include aqueous solutions, non-toxic excipients, including salts, preservatives, buffers and the like, as described, for instance, in REMINGTON'S PHARMACEUTICAL SCIENCES, 15th Ed., Easton: Mack Publishing Co., pp. 1405-1412 and 1461-1487 (1975) and 25 THE NATIONAL FORMULARY XIV., 14th Ed. Washington: American Pharmaceutical Association (1975), and the UNITED STATES PHARMACOPEIA XVIII. 18th Ed. Washington: American Pharmaceutical Association (1995), the

-58-

contents of which are hereby incorporated by reference.

Examples of non-aqueous solvents are propylene glycol, polyethylene glycol, vegetable oil and injectable organic esters such as ethyl oleate.

5 Aqueous carriers include water, alcoholic/aqueous solutions, saline solutions, parenteral vehicles such as sodium chloride, Ringer's dextrose, etc.

Intravenous vehicles include fluid and nutrient replenishers. Preservatives include antimicrobial, anti-oxidants, chelating agents and inert gases. The pH and exact concentration of the various components the pharmaceutical composition are adjusted according to routine skills in the art. See, Goodman and Gilman's THE PHARMACOLOGICAL BASIS FOR THERAPEUTICS

15 (7th Ed.).

According to the invention, such pharmaceutical composition could be administered orally, in the form of a liquid or solid, or injected intravenously or intramuscularly, in the form of a suspension or solution. By the term "pharmaceutically effective amount" is meant an amount that prevents cell degeneration and toxicity associated with fibril formation. Such amount would necessarily vary depending upon the age, weight and condition of the patient and would be adjusted by those of ordinary skill in the art according to well-known protocols. In one embodiment, a dosage would be between 0.1 and 100

-59-

mg/kg per day, or divided into smaller dosages to be administered two to four times per day. Such a regimen would be continued on a daily basis for the life of the patient. Alternatively, the pharmaceutical composition 5 could be administered intramuscularly in doses of .1 to 100 mg/kg every one to six weeks.

In yet another embodiment, the invention relates to a method of detecting amyloid deposits in biopsy or post-mortem tissue. The method involves incubating 10 formalin-fixed tissue with a solution of a compound of Formula I, described above. Preferably, the solution is 25-100% ethanol, (with the remainder being water) saturated with the compound of Formula I. Upon 15 incubation, the compound stains or labels the amyloid deposit in the tissue, and the stained or labelled deposit can be detected or visualized by any standard method. Such detection means include microscopic techniques such as bright-field, fluorescence, laser-confocal and cross-polarization microscopy.

20 In yet another embodiment, the invention relates to a method of quantifying the amount of amyloid in biopsy or post-mortem tissue. This method involves incubating a labelled derivative of Chrysamine G, preferably the compounds of Formula I, or a water-soluble, non-toxic salt thereof, with homogenate of 25 biopsy or post-mortem tissue. The tissue is obtained and homogenized by methods well known in the art. The preferred label is a radiolabel, although other labels

-60-

such as enzymes, chemiluminescent and immunofluorescent compounds are well known to skilled artisans. The preferred radiolabel is ^{125}I , ^{14}C or ^3H , the preferred label substituent of Formula I is at least one of R_1 -
5 R_7 , $\text{R}_{10}-\text{R}_4$. Tissue containing amyloid deposits will bind to the labeled derivatives of Chrysamine G. The bound tissue is then separated from the unbound tissue by any mechanism known to the skilled artisan, such as filtering. The bound tissue can then be quantified
10 through any means known to the skilled artisan. See Example 3. The units of tissue-bound radiolabeled Chrysamine G derivative are then converted to units of micrograms of amyloid per 100 mg of tissue by comparison to a standard curve generated by incubating
15 known amounts of amyloid with the radiolabeled Chrysamine G derivative.

In yet another embodiment, the invention relates to a method of distinguishing an Alzheimer's diseased brain from a normal brain involving obtaining tissue from (i) the cerebellum and (ii) another area of the same brain, other than the cerebellum, from normal subjects and from subjects suspected of having Alzheimer's disease. See Example 3. Such tissues are made into separate homogenates using methods well known to the skilled artisan, and then are incubated with a radiolabeled Chrysamine G derivative. The amount of tissue which binds to the radiolabeled Chrysamine G derivative is then calculated for each tissue type

-61-

(e.g. cerebellum, non-cerebellum, normal, abnormal) and the ratio for the binding of non-cerebellum to cerebellum tissue is calculated for tissue from normal and for tissue from patients suspected of having Alzheimer's disease. These ratios are then compared. If the ratio from the brain suspected of having Alzheimer's disease is above 90% of the ratios obtained from normal brains, the diagnosis of Alzheimer's disease is made. The normal ratios can be obtained from previously obtained data (see Table 3), or alternatively, can be recalculated at the same time the suspected brain tissue is studied.

EXAMPLE 1. THE SYNTHESIS OF CHRYSAMINE G AND DERIVATIVES THEREOF

Synthesis of Chrysamine G
The synthesis of Chrysamine G (i.e., 4,4'-bis(3-carboxy-4-hydroxyphenylazo)-biphenyl) requires the following reaction steps. These reaction steps will be referred to as the "Chrysamine G Synthesis" general procedure. Benzidine•2HCl (28.9 mg, 0.11 mmole, Sigma Chemical Company, St. Louis, MO) was added to 1.5 ml of 1:1 DMSO:distilled/deionized H₂O in a 50cc round bottom flask. Each of the reaction steps were carried out at 0°C unless otherwise specified. Twenty-nine μl of concentrated HCl were added, resulting in a clear solution after stirring. To the benzidine solution, a solution of 15.5 mg (0.22 mmole) of NaNO₂ in 300 μl of

-62-

1:1 DMSO/H₂O was added drop-wise, resulting in a pH of about 2-3. The reaction mixture was stirred for 45 min, and then to this tetra-azotized benzidine mixture was added drop-wise over a 10 min period to 24.8 mg (0.18 mmole) of methyl salicylate (Aldrich) dissolved in 2.0 ml of 100% DMSO containing 250 mg/ml Na₂CO₃, in suspension, keeping the pH about 10.5. The resulting mixture was stirred for 1 hr at 0°C, and then overnight at room temperature.

After this time, the pH was adjusted to about 7 and the mixture was extracted with three 50 ml portions of chloroform. The combined chloroform extracts were washed with three 50 ml portions of H₂O, and then taken to dryness yielding the dimethyl ester of Chrysamine G (i.e., 4,4'-bis(3-methoxycarbonyl-4-hydroxyphenylazo)-biphenyl), which was further purified by recrystallization from chloroform/hexane. The ester was then hydrolysed by dissolution in about 100 ml of 1:1 ethanol:H₂O containing four equivalents of NaOH and refluxed for three hours. Evaporation of the ethanol followed by lyophilization of the H₂O yielded the tetra-sodium salt of Chrysamine G. The free acid of Chrysamine G was formed by dissolving the tetra-sodium salt in H₂O, washing once with chloroform to remove any unhydrolysed dimethyl ester, lowering the pH to about 2 and extracting with three 50 ml portions of ethyl acetate. The combined ethyl acetate extracts were washed with three 50 ml portions of H₂O and taken

to dryness. Alternatively, hydrolysis was accomplished by dissolving the ester in THF and adding 15-20 molar equivalents of solid potassium tert-butoxide at room temperature and stirring for 15 minutes. After 5 acidification, the free acid was extracted into ethyl acetate which was then evaporated. The tetra-sodium salt was formed by addition of sodium methoxide to a suspension of the free acid in ethanol until the pH was approximately 9.5.

10 Under these conditions, there was no remaining methyl salicylate, salicylic acid, or benzidine, and only trace amounts of the mono-substituted product, 4-hydroxy-4'-(3-carboxy-4-hydroxyphenylazo)-biphenyl by reverse-phase HPLC using a C4 column (Vydac 214-TP510) 15 using a solvent system of sodium phosphate buffer (5 mM, pH 6):acetonitrile (ACN) 90:10, isocratically, for 10 min and then increased to 50% ACN over the next 20 min at a flow rate of 3.5 ml/min. The column eluant was monitored at 290 and 365 nm with a dual wavelength, 20 diode array detector (Perkin Elmer 235C). Under these conditions, Chrysamine G eluted at 17.6 min.

The structure of Chrysamine G and derivatives was confirmed by proton NMR at 500 MHz in DMSO-d₆ with TMS as the internal standard. The peak assignments for the 25 tetra-sodium salt of Chrysamine G were as follows with SA referring to protons at the specified ring position on the salicylic acid moiety and BZ referring to protons on the benzidine moiety: SA-3, doublet J=8.73

-64-

Hz at 6.75 parts per million (ppm); SA-4, doublet of doublets J=8.73 and 2.72 Hz at 7.82 ppm; BZ-2/6, doublet J=8.44 Hz at 7.91 ppm; BZ-3/5, doublet J=8.44 Hz at 7.95 ppm; and SA-6, doublet J=2.72 Hz at 8.28 5 ppm. The UV/visible spectrum in 40% ethanol showed a λ_{max} at 389 nm. The molar absorptivity of Chrysamine G was determined by calculating the concentration of Chrysamine G through comparison of peak areas to an internal standard by NMR and then immediately running 10 the UV/vis spectrum of an aliquot of the NMR sample diluted in 40% ethanol. The molar absorptivity in 40% ethanol at 389 nm was 5.5×10^4 AU/(cm \cdot M).

[^{14}C]Chrysamine G was synthesized by a modification of the above procedure. The tetra-azotization of 15 benzidine was performed as described above except in 100% H₂O. Fifty μ l of 2.5 M Na₂CO₃ in H₂O were added to 50 μ Ci of crystalline salicylic acid-carboxy- ^{14}C (Sigma) in a 0.5 ml conical glass vial. Sixty μ l of the tetra-azotized benzidine mixture was added to the 20 conical vial, vortexed and kept at 0°C for 1 hr. To prevent formation of the mono-substituted benzidine by-product, 12.5 μ l of 250 mM non-radioactive salicylic acid (Sigma) in 2.5 M Na₂CO₃ was added to the reaction mixture and maintained for 1 hr at 0°C. The vial was 25 kept overnight at room temperature. The entire mixture was dissolved in a minimal amount of 35% ACN and injected onto the C4 column as described above. The peak corresponding to the Chrysamine G standard was

collected and lyophilized. A specific activity of 26.8 Ci/mole was calculated by determining the absorbance at 389 nm and then counting the radioactivity in an aliquot of the same sample. The [¹⁴C]Chrysamine G was 5 stored in 40% ethanol. When the purified [¹⁴C]Chrysamine G was re-injected onto the C₄ column and eluted isocratically with 21% ACN at 3.5 ml/min, > 98% of the radioactivity co-eluted with authentic Chrysamine G at 10.4 min. Many of the Chrysamine G 10 derivatives were synthesized using this "Chrysamine G Synthesis" general procedure, with the exceptions noted below. Structures of the derivatives were verified by NMR. Figure 1 shows the chemical structure of Chrysamine G and several derivatives.

[³H]Chrysamine G, or other [³H]Chrysamine G derivatives such as 4,4'-bis(3-carboxy-4-hydroxy-5-phenylphenylazo)-3,3'-[³H]biphenyl was synthesized using 3,3'-[³H]benzidine. The 3,3'-[³H]benzidine (specific activity 50 Ci/mmole) was custom synthesized 20 by American Radiolabeled Chemicals (St. Louis, MO) by exposing 3,3'-diiodobenzidine (see below) to a large excess of high specific activity tritium gas in the presence of any of several catalysts well known in the art and excess N,N-di-isopropyl-ethylamine to consume acid generated in the reduction. After removal of the 25 labile tritium, preparative TLC was used to separate the 3,3'-[³H]benzidine from a small amount of incompletely reduced mono-iodobenzidine impurity.

-66-

Specifically, 11 nmoles of 3,3'-[³H]benzidine in 562 μ l of 0.01 N HCl on ice, stirred in a glass vial, was treated at one minute intervals with five portions of 2.2 μ moles of NaNO₂ in 5 μ l H₂O. After the last 5 portion, 22 μ moles of 3-phenylsalicylic acid (TCI) in 250 μ l of 2.5 M Na₂CO₃, was added and the ice was removed. After 5 minutes 50 μ l of 5 N HCl is added followed by 887. μ l of ethanol. The 4,4'-bis(3-carboxy-4-hydroxy-5-phenylphenoxy)-3,3'-[³H]biphenyl was purified by reverse-phase HPLC using a C4 column (Vydac 214-TP510) using a solvent system of sodium phosphate buffer (5 mM, pH 6.5)/ethanol (2.0 ml/min; 40-50% ethanol over a 10 min concave gradient, then holding at 50% for 15 min). The product co-eluted with authentic 10 sample.

15

Synthesis of the 3-Isopropylsalicylic Acid Derivative of Chrysamine G
4,4'-bis(3-carboxy-4-hydroxy-5-isopropylphenoxy)-3-iodobiphenyl is synthesized by 20 substituting 3-bromobenzidine (see below) for benzidine and methyl 3-isopropylsalicylate for methyl salicylate in the Chrysamine G Synthesis described above. The bromo derivative thus obtained is converted to the tri-alkyl tin and then to the iodo derivative as described 25 in detail below.

-67-

Synthesis of the 3-Phenyl-, 3-(2-Phenylethene)-,
and 3-(2-Phenylethyl)-salicylic Acid Derivative of
Chrysamine G

4,4'-bis(3-carboxy-4-hydroxy-5-phenylphenylazo)-3-
5 iodobiphenyl is synthesized by substituting 3-
bromobenzidine (see below) for benzidine and methyl 3-
phenylsalicylate [made by esterification of 3-
phenylsalicylic acid (TCI America, Portland, OR)] for
methyl salicylate in the Chrysamine G Synthesis
10 described above. The bromo derivative thus obtained is
converted to the tri-alkyl tin and then to the iodo
derivative as described in detail below. Other
derivatives using benzidine or other substituted
benzidines described below are made by substituting the
15 appropriate benzidine derivative.

4,4'-bis(3-carboxy-4-hydroxy-5-(2-phenylethene)-
phenylazo)-3-iodobiphenyl is made by the above
procedure using methyl 3-(2-phenylethene)-salicylate in
the place of methyl salicylate. 3-(2-phenylethene)-
20 salicylate is synthesized by coupling diethyl
benzylphosphonate (Aldrich) to 3-formylsalicylic acid
(Aldrich) by the procedure described below for the
synthesis of vinyl (C=C) derivatives of Chrysamine G.

4,4'-bis(3-carboxy-4-hydroxy-5-(2-phenylethyl)-
phenylazo)-3-iodobiphenyl is made by the above
procedure using methyl 3-(2-phenylethyl)-salicylate in
the place of methyl salicylate. 3-(2-phenylethyl)-
salicylate is synthesized by reduction of 3-(2-

-68-

phenylethene)-salicylate with hydrogen over a palladium or platinum on carbon catalyst.

Synthesis of Vinyl (C=C) derivatives of
Chrysamine-G

5 4,4'-biphenyldicarboxylic acid (Aldrich) is converted by reduction with LiAlH₄ to 4,4'-bis(hydroxymethyl)biphenyl, which, in turn, is converted to 4,4'-bis(iodomethyl)biphenyl by reaction with NaI and BF₃-etherate in ACN. The iodo compound is
10 heated to 90°C for one hour with excess triethyl phosphite to produce tetraethyl 4,4'-biphenyldimethylphosphonate. Similar treatment of 1,4-naphthalene-dicarboxylic acid (Aldrich) or 9,10-anthracene-dicarboxylic acid (Aldrich) yields the
15 respective tetraethyl phosphonates. After recrystallization from hexane, the phosphonate is dissolved in DMF and treated with a ten-fold excess of sodium methoxide, followed by two equivalents of 5-formylsalicylic acid in DMF. After stirring at room
20 temperature for 24 hrs, the reaction mixture is poured into water. Acidification of the water to pH 5.0 with HCl causes precipitation of the fluorescent product, 4,4'-bis(3-carboxy-4-hydroxyphenylethenyl)-biphenyl, which can be selectively extracted into ethyl acetate
25 from any mono-substituted by-product. Similar treatment of tetraethyl p-xylylenediphosphonate (TCI America) with 5-formylsalicylic acid, or it's

-69-

derivatives, gives 1,4-bis(3-carboxy-4-hydroxyphenylethenyl)-benzene. Similar treatment of diethyl benzylphosphonate (Aldrich) with 3-formylsalicylic acid, gives 3-(2-phenylethene)-salicylic acid. Likewise 1,4-bis(3-carboxy-4-hydroxyphenylethenyl)-naphthalene or 9,10-bis(3-carboxy-4-hydroxyphenylethenyl)-anthracene is obtained by treating the appropriate phosphonate with 5-formylsalicylic acid. Other derivatives are obtained by the use of other formylsalicylic acid congeners, formyl benzoic acids, or hydroxy- or methoxybenzaldehydes.

Synthesis of Amide derivatives of Chrysamine G
4,4'-biphenyldicarboxylic acid (Aldrich) is converted to the acid chloride by reaction with excess thionyl chloride in DMF. After removal of the remaining thionyl chloride on a rotary evaporator, this acid chloride is added to a solution of two equivalents of 5-aminosalicylic acid and triethylamine. The 4,4'-bis(3-carboxy-4-hydroxyphenylamido)-biphenyl precipitates upon pouring the DMF solution into dilute HCl.

Synthesis of Schiff Base ($\text{CH}=\text{N}$) derivatives of Chrysamine G
4,4'-biphenyldicarboxylic acid (Aldrich) is converted by reduction with LiAlH_4 to 4,4'-

-70-

bis(hydroxymethyl)biphenyl, which, in turn, is converted to 4,4'-biphenyldicarboxaldehyde by treatment with BaMnO₄ in ethyl acetate. The dialdehyde is dissolved in DMF and treated with 5-aminosalicylic acid 5 dissolved in DMF. The resultant suspension of Schiff base is added to ten volumes of water and extracted into ethyl acetate to yield the desired product. Alternatively, 3- or 5-formylsalicylic acid can be coupled in an analogous manner to substituted or 10 unsubstituted benzidine analogues.

Synthesis of Amine derivatives of Chrysamine G

The suspension of Schiff base in DMF described above is treated with excess NaBH₄, dissolved in ethanol and then refluxed for one hr. The resulting secondary 15 amine is isolated by neutralizing the excess NaBH₄ with HCl, pouring the solution into ten volumes of water, and extracting into ethyl acetate.

Synthesis of Hydrazo (NH-NH) derivatives of Chrysamine G

Chrysamine G and other azo compounds are dissolved 20 in ethanol and treated with two equivalents of PdCl₂ and ten equivalents of NaBH₄ at room temperature. The solution quickly loses its color. The ethanol suspension is filtered to remove the reduced 25 palladium, poured into dilute HCl, and extracted into ethyl acetate.

-71-

Synthesis of Hydrazone (NH-N=C) derivatives

In general, hydrazone derivatives are prepared by reaction of 4,4'-dihydrazinobiphenyl with a suitable ketone, or by reaction of substituted or unsubstituted 5 tetra-azotized benzidine derivatives with active hydrogen compounds. A specific example of the latter method follows. Benzidine is tetra-azotized by the same procedure used for the synthesis of Chrysamine G. This tetra-azotized solution is added to a solution of 10 two equivalents of 4-hydroxy-5-methyl-4-cyclopentene-1,3-dione (Aldrich) dissolved in DMSO containing 250 mg/ml Na₂CO₃ in suspension, keeping the pH about 10.5. The resulting mixture was stirred for 1 hr at 0°C, and then overnight at room temperature. The hydrazone 15 product was obtained by dilution of the reaction mixture into ten volumes of water, acidification with HCl, and extraction into ethyl acetate.

Synthesis of Pyridine and Diazine Derivatives of Chrysamine G

20 4,4'-bis(5-carboxy-6-hydroxy-3-pyridylazo)-3-iodobiphenyl and related hydroxypyridinecarboxylic or hydroxydiazinecarboxylic acid derivatives of Chrysamine G are synthesized by substituting 3-bromobenzidine (see below) for benzidine and 2-hydroxynicotinic acid (or, 25 for related derivatives, 6-hydroxynicotinic acid, 3-hydroxypicolinic acid, or hydroxydiazinecarboxylic acids such as 4-hydroxypyrimidine-6-carboxylic acid)

- 72 -

for methyl salicylate in the Chrysamine G Synthesis described above. The bromo derivative thus obtained is converted to the tri-alkyl tin and then to the iodo derivative as described in detail below.

- 5 **Synthesis of Naphthalene, Quinoline, and Benzodiazine Derivatives of Chrysamine G**
4,4'-bis(3-carboxy-4-hydroxy-naphthylazo)-3-
iodobiphenyl and related hydroxynaphthoic,
hydroxyquinolinecarboxylic, or
10 hydroxybenzodiazinecarboxylic acid derivatives of Chrysamine G are synthesized by substituting 3-bromobenzidine (see below) for benzidine and 1-hydroxy-2-naphthoic acid (or, for related derivatives, other hydroxynaphthoic acid isomers,
15 hydroxyquinolinecarboxylic acids such as kynurenic acid, or hydroxybenzodiazinecarboxylic acids such as 5-hydroxyquinoxaline-6-carboxylic acid) for methyl salicylate in the Chrysamine G Synthesis described above. The bromo derivative thus obtained is converted to the tri-alkyl tin and then to the iodo derivative as
20 described in detail below.

Synthesis of Nitrophenol Derivatives of Chrysamine G

- 25 4,4'-bis(3-nitro-4-hydroxy-phenylazo)-3-
iodobiphenyl and related nitrophenol derivatives of Chrysamine G are synthesized by substituting 3-

bromobenzidine (see below) for benzidine and 2-nitrophenol (or other nitrophenol isomers for related derivatives) for methyl salicylate in the Chrysamine G Synthesis described above. The bromo derivative thus obtained is converted to the tri-alkyl tin and then to the iodo derivative as described in detail below.

Alternative Method for the Synthesis of Diazo Compounds

As an alternative method of forming azo compounds, 10 nitroso compounds are coupled to amines in glacial acetic acid by the Mills reaction. Badger, G. et al., Aust. J. Chem. 17: 1036 (1964). Nitroso compounds are made by the method of Coleman et al., *Organic Synthesis Collective Vol. III*: p668. For example, 3-nitrobenzoic acid (Aldrich Chem. Co., Milwaukee, WI) (2.44 mmoles) and a solution of 150 mg of NH₄Cl in 5 ml of water are combined in a 50 ml round-bottomed flask and stirred vigorously. Zinc dust (372 mg) is added in small portions over 5 minutes. After the addition of zinc is complete the temperature begins to rise, but is kept between 50 and 55°C by the use of an ice bath. The mixture is stirred at that temperature for 20 minutes and then the zinc residues are filtered and washed with boiling water. The combined filtrate and washings are cooled to 0°C in a beaker by the addition of ice. To this cold mixture of the hydroxylamine, a cold solution of sulfuric acid (750 µl of concentrated acid plus

-74-

enough ice to bring the temperature to -5°C) is added with stirring. An ice-cold solution of 170 mg of sodium dichromate dihydrate in 750 µl of water is added all at once with stirring. The resulting 3-
5 nitrosobenzoic acid thus obtained is combined with one-half of an equivalent of benzidine, 2,7-diaminofluorene or another benzidine derivative in glacial acetic acid and warmed to 70-80°C for 7 hrs and then allowed to stand at room temperature overnight. The mixture is
10 diluted with water and extracted with ethyl acetate giving 4,4'-bis(3-carboxy-phenylazo)-biphenyl, 2,7-bis(3-carboxy-phenylazo)-fluorene, or the corresponding bis(3-carboxy-phenylazo) derivative of the particular benzidine derivative employed.

15 **Synthesis of Methoxy Derivatives**

Methoxy derivatives of all phenol compounds are synthesized by the following procedure. To one equivalent of the phenolic Chrysamine G ester derivative dissolved in acetone at an approximate concentration of 5 mg/ml, is added 10 equivalents of methyl iodide (Aldrich Chemical Company, Milwaukee, WI) and 10 equivalents of K₂CO₃. The suspension is refluxed for 6-24 hrs, taken to dryness on a rotary evaporator, and extracted with chloroform. The ester
20 is hydrolysed by addition of 1:1 THF/0.1 N NaOH to a concentration of approximately 1 mg/ml and stirring at room temperature from 24-72 hours. Unhydrolysed
25

-75-

methoxy-ester is removed by extraction with chloroform, the pH was adjusted to ~2, and the methoxy-acid was extracted into ethyl acetate.

Synthesis of Substituted Benzidine Derivatives

For the substituted benzidine compounds, the above Chrysamine G synthesis general procedure is followed except 3,3'-dichlorobenzidine (Pfaltz & Bauer, Waterbury, CT), 4,4'-diaminoctafluorobiphenyl, 3,3',5,5'-tetramethylbenzidine (Aldrich Chemical Company, Milwaukee, WI), 3,3'-dimethylbenzidine (Aldrich Chemical Company, Milwaukee, WI), 3,3'-dimethoxybenzidine (Aldrich Chemical Company, Milwaukee, WI), benzidine-3,3'-dicarboxylic acid (Pfaltz & Bauer, Waterbury, CT) or lower alkyl esters thereof, or 3,3'-dinitrobenzidine (Fluka Chemical Corp., Ronkonkoma, NY) are used in place of unsubstituted benzidine. Other substituted benzidines including, but not limited to, those listed below are synthesized by the referenced methods and also can be used in place of unsubstituted benzidine: 3,3'-dibromobenzidine and 3,3'-diiodobenzidine (Snyder, H. et al., J. Am. Chem. Soc. 71: 289-291, 1949); 3-bromobenzidine and 3-iodobenzidine (Badger, G. et al., Aust. J. Chem. 17: 1036-1049, 1964; Holland, V. et al., Tetrahedron 30: 3299-3302, 1974).

-76-

**Synthesis of Phenanthracene, Benzo(c)cinnoline,
Fluorene, Fluorenone, Carbazole, Dibenzofuran,
Dibenzothiophene and Dibenzothiophene-9,9-dioxide
Derivatives**

5 Fluorene (2,2'-methylenebiphenyl) derivatives of Chrysamine G are made by substituting 2,7-diamino-fluorene (Aldrich Chemical Company, Milwaukee, WI) for benzidine in the tetra-azotization procedures and then coupled by the same procedures used for tetra-azotized 10 benzidine. Likewise, 2,7-diaminophenanthracene, 2,7-diamino-3,6-dimethylbenzo[c]cinnoline, 2,7-diaminofluorenone, 9-methyl-2,7-diaminocarbazole, 3,7-diaminodibenzofuran (unlike the remainder of these polycyclic compounds, the conventional numbering system 15 puts the oxygen bridge atom of dibenzofurans at the 5-position instead of the 9-position, therefore the amino substituents are in the 3,7-positions rather than the 2,7-positions as in the other compounds even though, spatially, the positions are equivalent), 2,7-diaminodibenzothiophene, and 2,7-diaminodibenzothiophene-9,9-dioxide ("benzidine sulphone") are substituted for benzidine in the standard tetra-azotization and coupling procedures. 9-Methyl-2,7-diaminocarbazole compounds may be N-demethylated after coupling if the unsubstituted carbazole is desired. 2,7-Diaminophenanthracene is synthesized by reduction of 2,7-dinitrophenanthracene made from 2-amino-3',5-dinitro-cis-stilbene by the method of Ullmann and Mallet Ber. 31: 1694-1696, 1898

-77-

and Nunn, A. et al., J. Chem. Soc. 1952: 2797-2803.

2,7-Diamino-3,6-dimethylbenzo[c]cinnoline is prepared by NaOBr oxidation of the corresponding hydrazo compound formed via the reduction of 3,3'-dimethyl-
5 6,6'-dinitrobenzidine (Aldrich Chemical Co., Milwaukee, WI) with zinc in aqueous NaOH by the method of Snyder et al., J. Amer. Chem. Soc. 71: 289 (1949).

Alternatively, 3,3'-dimethyl-6,6'-dinitrobenzidine can be first tetra-azotized and coupled in place of benzidine, followed by treatment with Zn/NaOH and NaOBr as above. 2,7-Diaminofluorenone is synthesized by reduction of 2,7-dinitrofluorenone made from 2-amino-
10 3',5-dinitrobenzophenone by the method of Ullmann and Mallet Ber. 31: 1694-1696, 1898 and Nunn, A. et al., J. Chem. Soc. 1952: 2797-2803.

15 9-Methyl-2,7-diaminocarbazole is synthesized by reduction of 9-methyl-2,7-dinitrocarbazole made by N-methylation of 2,7-dinitrocarbazole prepared from 2-amino-3',5-dinitrodiphenylamine as described in Saunders, K.H. and Allen, R.L.M. AROMATIC DIAZO COMPOUNDS 625-640 (Edward Arnold, London, 1985), the entire contents of which are hereby incorporated by reference.

20 3,7-Diaminodibenzofuran is synthesized by reduction of 3,7-dinitrodibenzofuran made from 2-amino-3',5-dinitrodiphenylether as described in Saunders, K.H. and Allen, R.L.M. AROMATIC DIAZO COMPOUNDS 625-640 (Edward Arnold, London, 1985), the entire contents of which are hereby incorporated by reference.

25 2,7-

-78-

Diaminodibenzothiophene, and 2,7-diaminodibenzothiophene-9,9-dioxide are prepared by the methods of Courtot and Evain Bull. Soc. Chim. 49(iv): 528, 1931 and Cullinane and Davies Rec. Trav. Chim. 55: 5 881-886 (1936).

Synthesis of Alkynyl (C=C) Derivatives of Chrysamine G

5-Iodosalicylic acid (Aldrich Chemical Company, Milwaukee, WI) is converted to the methyl ester by reaction with methanol, trimethyl orthoformate and sulfuric acid. The 5-iodosalicylic acid methyl ester thus obtained is reacted with (trimethylsilyl)acetylene (Aldrich Chemical Company, Milwaukee, WI) in the presence of palladium. The trimethylsilyl group is removed and two equivalents of the resultant 5-acetylenylsalicylic acid methyl ester is reacted with 4,4'-dibromobiphenyl (Aldrich Chemical Company, Milwaukee, WI) in the presence of palladium as above. The resultant alkynyl analogue of Chrysamine G, 4,4'-bis(3-methoxycarbonyl-4-hydroxyphenylacetylenyl)-biphenyl is prepared by hydrolysis of the ester as described above. This alkynyl analogue is reduced by conventional methods to form the vinyl analogue of Chrysamine G.

- 79 -

Synthesis of Diiodosalicylic Acid Derivative of Chrysamine G

The 3-iodosalicylic acid derivative of Chrysamine G, 4,4'-bis(3-carboxy-4-hydroxy-5-iodophenylazo)-biphenyl), is synthesized by iodination of 5-iodosalicylic acid (Aldrich Chemical Company, Milwaukee, WI) at the 3-position followed by selective de-iodination of the 5-position. After formation of the methyl ester and recrystallization, the light brown, waxy 3-iodo derivative is substituted for methyl salicylate in the above procedure for the synthesis of Chrysamine G. The desired product is separated by elution from a silica gel column with 75% CHCl_3 /25% hexane. The ester is then hydrolysed by dissolution in 1:1 ethanol: H_2O containing four equivalents of NaOH and refluxed for three hours.

Synthesis of Di-fluoro Chrysamine G

The 5-fluoro derivative, 4,4'-bis(2-hydroxy-3-carboxy-5-fluorophenylazo)-biphenyl), is synthesized by substituting 5-fluorosalicylic acid (Aldrich Chemical Company, Milwaukee, WI) for salicylic acid. $[^{18}\text{F}]$ aryl fluorides derivatives of Chrysamine G can be prepared by substituting ^{18}F -labeled precursors such as $[^{18}\text{F}]\text{LiBF}_4$, in the Schiemann reaction, via triazene decomposition with Cs $[^{18}\text{F}]$, or via nucleophilic ^{18}F -for-X substitution, where X = tosyl, triflate, NO_2 , $\text{N}(\text{CH}_3)_2$, or halogen. See Fowler, J. and Wolf, A. in

18 labeling of radiopharmaceuticals. (Natl. Acad.
5 Press, Washington, D.C.) (1990).

Synthesis of Aromatic Fluoroalkyl and Fluoroalkoxy
Derivatives

Aromatic fluoroalkyl derivatives are synthesized
employing the method of Bishop et al., *J. Med. Chem.*
10 34: 1612 (1991) in which Claisen rearrangement of the
appropriate O-allyl ethers forms an aromatic allyl
derivative which can be further functionalized to yield
the fluoroethyl or fluoropropyl derivatives.
Alternatively, an aromatic iodide can be readily
15 converted to an aromatic alkyne consisting of two to
five carbon atoms in length using the palladium-
assisted coupling methodology of Sonogashira et al.,
Tetrahedron Letters 4467-4470 (1975). Subsequent
derivatization of the alkyne yields the fluoroalkyl
20 derivative. Fluoroalkoxy derivatives may be prepared
by the method of Chumpradit et al., *J. Med. Chem.* 36:
21 (1993) in which alkylation of the appropriate phenol
with the appropriate 1-bromo (or iodo or sulfonyloxy)-
omega-fluoroalkane yields the corresponding
25 fluoroalkoxy derivative.

-81-

Radiofluorination of Aromatic Alkylsulfonyloxy and Alkoxyssulfonyloxy Derivatives

Radiofluorination to yield the aromatic [¹⁸F]fluoroalkyl and [¹⁸F]fluoroalkoxy derivatives is 5 performed by the method of Mathis et al., Nucl. Med. Biol. 19: 571 (1992) in which aromatic alkyl- or alkoxyssulfonyloxy (e.g. alkoxytosylate) derivatives are substituted with [¹⁸F]fluoride to yield aromatic [¹⁸F]fluoroalkyl and [¹⁸F]fluoroalkoxy compounds.

10 **Radio-Iodination and Radio-Bromination of Chrysamine G Derivatives by the Tri-Alkyl Tin Route**

Synthesis of Tri-Alkyl Tin Derivatives of Chrysamine G

15 The general structure of the tri-alkyl tin derivative of Chrysamine G is shown in Figure 2B. In general, one tri-alkyl tin group will be substituted at the 3-position on one side of the biphenyl moiety, but other positions, including the salicylic acid or heterocyclic moiety are also potential targets. These 20 tri-alkyl tin derivatives are stable immediate precursors for preparation of the radioiodinated and radiobrominated compounds to be used in humans. More specifically, these tri-alkyl tin derivatives are used 25 to prepare the halogenated radioactive compounds applicable for use in in vivo imaging of amyloid.

General Procedures for the Synthesis of Tri-Alkyl Tin Derivatives

Tri-alkyl tin derivatives are prepared from the appropriate arylhalides, $[(C_6H_5)_3P]_3Pd(0)$, and hexabutylditin by previously published procedures including Kosugi, M., et al., Chem. Lett. 1981: 829; Heck, R. Pure and Appl. Chem. 1978: 691; Echavarren, A. and Stille, J. J. Am. Chem. Soc. 1987: 5478; Mitchell, T. J. Organometallic Chem. 1986: 1; and Stille, J. Pure and Applied Chem. 1985: 1771. These derivatives also can be obtained by the use of n-BuLi and trialkyl tin chloride by the procedure of Mathis et al., J. Labell. Comp. and Radiopharm. 1994: 905.

15 Synthesis of the 3-trialkyl tin derivative of 4,4'-bis(3-methoxycarbonyl-4-hydroxyphenylazo)-biphenyl

3-Bromo or 3-iodo-4,4'-bis(3-methoxycarbonyl-4-hydroxyphenylazo)-biphenyl or its dimethyl ether are prepared by synthesis of 3-bromo- or 3-iodobenzidine (see above), tetra-azotization and coupling to methyl salicylate as for the synthesis of Chrysamine G, and methylation of the phenol as described above when the methoxy compound is desired. Under an argon atmosphere, 1 mmol of the phenolic ester or the methoxy ester, $[(C_6H_5)_3P]_3Pd(0)$ (0.1 to 0.2 mmol), hexabutylditin or hexamethyl ditin (1.25 mmol), and dioxane (25 ml) is heated at 70°C for 16 hrs. The reaction mixture is cooled and the solvent is

- 83 -

evaporated. Tri-alkyl tin halide is removed with aqueous KF. The organics are extracted with ethyl acetate, dried over magnesium sulfate, filtered, and the solvent is evaporated under reduced pressure. The residue is purified on silica gel to obtain 3-trialkyltin-4,4'-bis(3-methoxycarbonyl-4-hydroxyphenylazo)-biphenyl.

-84-

Radio-Iodination or Radio-Bromination of Tri-Alkyl Tin Derivatives

The tributyl or trimethyl tin derivatives are radio-iodinated with Na[¹²⁵I] or Na[¹²³I] or radio-brominated with Na[⁷⁵Br] or Na[⁷⁶Br] by published procedures such as Mathis et al., *J. Labell. Comp. and Radiopharm.* 1994: 905; Chumpradit et al., *J. Med. Chem.* 34: 877 (1991); Zhuang et al., *J. Med. Chem.* 37: 1406 (1994); Chumpradit et al., *J. Med. Chem.* 37: 4245 (1994). In general, 0.5 mg of tri-alkyl tin compound, 0.2 ml of anhydrous acetonitrile, 10 μ l of 2M H₃PO₄, 2-100 μ l of a solution of high specific activity (>2000 Ci/mmol) Na[¹²⁵I] or Na[¹²³I] (or Na[⁷⁵Br] or Na[⁷⁶Br]) in pH 9-12 NaOH, and dichloramine-T (DCT) (20 μ l of 2.5 mg/ml DCT in acetonitrile) are placed in a 1 ml Reacti-vial. The vial is capped and the mixture is stirred at room temperature in the dark. The reaction is monitored by HPLC and after 30 min is quenched with 50 μ l of 2 M Na₂S₂O₃. The product is purified by standard chromatographic techniques. Mathis et al., *J. Labell. Comp. and Radiopharm.* 1994: 905. Similarly, low specific activity ¹⁸F derivatives are prepared by analogous procedures.

General Procedures for the Preparation of Non-Radioactive I, Br, Cl, F and -SH Derivatives

In general, 3- or 4-amino derivatives of salicylic acid, or the corresponding derivatives of the heterocyclic analogues of salicylic acid shown in Figure 2, are converted to the corresponding diazo compounds with sodium nitrite and HCl or H₂SO₄. The iodine derivatives are directly prepared by forming the diazonium iodide which is then converted into the aryl iodide, or by way of the triazene intermediates. See, e.g., Greenbaum, F. Am. J. Pharm. 108: 17 (1936), Satyamurthy, N. and Barrio, J., J. Org. Chem. 48: 4394 (1983) and Goodman, M. et al., J. Org. Chem. 49: 2322 (1984). Aryl bromides and chlorides are prepared from the diazo compounds by treatment with CuCl or CuBr according to the Sandmeyer reaction or via the triazene as for the iodine derivatives. Aryl fluorides are prepared by treating the diazonium compounds with NaBF₄, HBF₄, or NH₄BF₄, according to the Schiemann reaction or via triazene decomposition similar to the iodine derivatives. Aryl thiols are prepared from the diazonium compounds by treatment with sulfur-containing nucleophiles such as HS⁻, EtO-CSS⁻, and S₂²⁻. Alternatively, aryl thiols can be prepared by replacement of aryl halides with sulfur containing nucleophiles. These reactions are described in March, J., ADVANCED ORGANIC CHEMISTRY: REACTIONS, MECHANISMS, AND STRUCTURE (3rd Edition, 1985).

-86-

**General Procedures for the Preparation of
Radioactive C, F and Tc Derivatives**

In addition to the above procedures, high specific activity radiolabeling with 99m Tc for SPECT or with the positron-emitting radionuclides 11 C, 18 F, 75 Br and 76 Br is accomplished according to literature-based methods well known in the art. Some of the potential specific methods are described below, but there are other well-known methods which will be apparent to those skilled in the art and are described in Fowler, J. and Wolf, A. *Positron emitter-labeled compounds in POSITRON EMISSION TOMOGRAPHY AND AUTORADIOGRAPHY* (Phelps, M., Mazziota, J., and Schelbert, H. eds.) p 391-450 (Raven Press, NY) (1986), Coenen, H. et al., *Radiochimica Acta* 34: 47 (1983), and Kulkarni, *Int. J. Rad. Appl. & Inst.* (Part B) 18: 647 (1991), the contents of which are hereby incorporated by reference.

99m Tc derivatives are prepared by complexation with the aryl thiols. Radiolabeling with 11 C can be readily done via N-methylation, O-methylation as described above substituting [11 C]methyl iodide, [11 C]alkylation, or [11 C] carboxylation of suitable Chrysamine G analogues. [18 F]aryl fluorides derivatives can be prepared by substituting 18 F-labeled precursors such as [18 F]LiB₄ in the Schiemann reaction described above, via triazene decomposition with Cs[18 F], or via nucleophilic 18 F-for-X substitution, where X = tosyl,

-87-

triflate, NO_2 , $\text{N}(\text{CH}_3)_2$, or halogen. Radiobromination using ^{75}Br and ^{76}Br can be accomplished using either electrophilic (Br^+) or nucleophilic (Br^-) substitution techniques analogue to radioiodination techniques; see
5 Coenen, H., *supra*.

Synthesis of the 3-Hydroxy-1,2-benzisoxazole derivative and related derivatives (see Figure 2C)

2,6-Dihydroxybenzoic acid (γ -resorcylic acid) methyl ester (TCI America, Portland, OR) is converted
10 to the hydroxamic acid by the use of hydroxylamine hydrochloride according to the method of Böshagen (Chem. Ber 100: 954-960; 1967). The hydroxamic acid is converted to the corresponding 3-hydroxy-1,2-benzisoxazole with the use of SOCl_2 , and then
15 triethylamine, also by the method of Böshagen (Chem. Ber 100: 954-960; 1967). This compound is then coupled with benzidine, 3-bromobenzidine, or other benzidine derivatives via the same procedure used for salicylic acid derivatives. The bromo derivatives can then
20 converted to the tri-alkyl tin and iodo-derivatives as described above.

Alternatively, methyl salicylate is coupled to benzidine as usual and the resulting 4,4'-bis(3-methoxycarbonyl-4-hydroxyphenylazo)-biphenyl (or the dimethyl ester of Chrysamine G) is converted to the hydroxamic acid and then the benzisoxazole by the
25 method of Böshagen as described above. A third type of

-88-

3-hydroxy-1,2-benzisoxazole is synthesized from the dimethyl esters of several isomeric dihydroxy benzeneddicarboxylic acids including 4,6-dihydroxy-1,3-benzeneddicarboxylic acid, 3,6-dihydroxypthalic acid, 5 and 2,5-dihydroxyterephthalic acid (Aldrich Chem. Co., Milwaukee, WI). After coupling to benzidine or its derivatives by standard procedures, the dihydroxy/diesters is converted to dihydroxy/dihydroxamic acids by reaction with 10 hydroxylamine by the method of Böshagen described above. Conversion to the double benzisoxazole is effected by treatment with SOCl_2 and triethylamine, again, by the method of Böshagen described above.

15 **Synthesis of the phthalimide or isoindole-1,3(2H)-dione derivative (see Figure 2D)**

3-Hydroxypthalimide made from 3-hydroxypthalic anhydride (Aldrich Chemical Company, Milwaukee, WI) is coupled with benzidine or its derivative via the same procedure used for salicylic acid derivatives and then 20 converted to the tri-alkyl tin and iodo-derivatives as described above.

-89-

**Synthesis of the phthalhydrazide or 2,3-benzodiazine-1,4(2H,3H)-dione derivative
(see Figure 2E)**

3-Hydroxyphthalhydrazide made from the reaction of
5 3-hydroxyphthalic anhydride (Aldrich Chemical Company,
Milwaukee, WI) with hydrazine is coupled with benzidine
or its derivative via the same procedure used for
salicylic acid derivatives and then converted to the
tri-alkyl tin and iodo-derivatives as described above.

10 **Synthesis of the 2,3-benzoxazine-1,4(3H)-dione derivative (see Figure 2F)**

3-Hydroxyphthalic anhydride (Aldrich Chemical
Company, Milwaukee, WI) is converted to the 2,3-
benzoxazine with the use of hydroxylamine. The
15 benzoxazine derivative is then coupled with benzidine
or its derivative via the same procedure used for
salicylic acid derivatives and then converted to the
tri-alkyl tin and iodo-derivatives as described above.

20 **Synthesis of the (2H)1,3-benzoxazine-2,4(3H)-dione derivative (see Figure 2G)**

This compound is synthesized by the method of
Effenberger et al., (Chem. Ber. 105: 1926-1942; 1972).
Briefly, phenol is coupled with benzidine or its
derivative via the same procedure used for salicylic
25 acid derivatives. This adduct is then converted to the
carbamate by reaction with ethoxycarbonylisocyanate
(O=C=N-CO-O-Et) in the presence of triethylamine. This

-90-

substituted carbamate (or N-ethoxycarbonyl-carbamic acid-phenyl ester) is converted to the benzoxazinedione by heating in diphenyl ether. The benzoxazinedione is then converted to the tri-alkyl tin and iodo-
5 derivatives, as described above.

Synthesis of the (3H)-benzazine-1,3(2H)-dione derivative (see Figure 2H)

3-Hydroxyphenylacetic acid (Aldrich Chemical Company, Milwaukee, WI) is converted to the amide and
10 then coupled with benzidine or its derivative via the same procedure used for salicylic acid derivatives. This adduct is then converted to the N-(3-hydroxyphenylacetoxy)-carbamic acid ethyl ester derivative by reaction with ethyl chloroformate. This
15 substituted carbamate is converted to the benzazinedione by heating in diphenyl ether. The benzazinedione is then converted to the tri-alkyl tin and iodo-derivatives, as described above.

Synthesis of the 1,8-Naphthalimide derivative
20 (See Figure 2I)

4-Amino-1,8-naphthalimide is coupled with benzidine or its derivative via standard procedures for diazo coupling of aryl amines, as described in Saunders, K.H. and Allen, R.L.M. AROMATIC DIAZO
25 COMPOUNDS (Edward Arnold, London, 1985), the entire contents of which are hereby incorporated by reference.

-91-

The diazo naphthalimide is then converted to the tri-alkyl tin and iodo-derivatives, as described above.

**Synthesis of Tetrazole and Oxadiazole Derivatives
(See Figure 2J and 2K)**

5 2-Cyanophenol (Aldrich Chemical Company,
Milwaukee, WI) is converted to the tetrazole by
reaction with sodium or aluminum azide according to the
method of Holland and Pereira J. Med. Chem. 10: 149
(1967) and Holland U.S. Patent No. 3,448,107. Briefly,
10 2-cyanophenol or cyanophenol derivatives of Chrysamine
G (1 mmol) in 40 ml DMF is treated with sodium azide
(10 mmol) and triethylamine hydrochloride (10 mmol)
under argon. The mixture is stirred at 120°C for 2 hrs
after which the mixture is cooled and worked up in a
15 manner analogous to that described above for Chrysamine
G.

20 The oxadiazoles are synthesized by treatment of
the tetrazoles prepared as above with an acid anhydride
(such as acetic anhydride). An alternate method is
that of Bamford et al., J. Med. Chem. 38: 3502 (1995).
In this procedure, hydrazide derivatives of Chrysamine
G or salicylic acid (obtained by treatment of the
respective esters with hydrazine) are treated with
methyl isothiocyanate in the presence of
25 dicyclohexylcarbodiimide.

-92-

**Synthesis of Chrysamine G Derivatives for
Use as Controls**

The aniline derivative is synthesized by substituting two equivalents of aniline (Fisher 5 Chemical Co., Fair Lawn, NJ) for each equivalent of benzidine. The 2,2'-disulfonic acid derivative is synthesized by substituting benzidine-2,2'-disulfonic acid (Pfaltz & Bauer, Inc., Waterbury, CT) for benzidine. The phenol derivative is synthesized by 10 substituting one equivalent of phenol for each equivalent of salicylic acid. Congo red (Aldrich certified grade) is obtained commercially.

**EXAMPLE 2. CHRYSAMINE G AND CHRYSAMINE G
DERIVATIVES BIND SPECIFICALLY TO A_B**

15 **Binding to synthetic A_B(10-43)**

Chrysamine G binds well to synthetic A_B(10-43) peptide in vitro. Figure 4A shows a Scatchard analysis of the binding of Chrysamine G to A_B(10-43). The higher affinity component has a K_d of 0.257 μM and a B_{max} of 3.18 nmoles Chrysamine G/mg A_B(10-43). The lower affinity component is less well defined by these data, but appears to have a K_d of 4.01 μM and a B_{max} of 18.7 nmoles Chrysamine G/mg A_B(10-43). The low affinity component represents the binding of Chrysamine G at high concentrations to a distinct, low-affinity site, not the binding to an impurity in the 20 25

-93-

preparation. The amount of Chrysamine G injected in vivo is so low that there is not any binding to the low-affinity component. At very low concentrations, the ratio of high-to-low affinity binding is very 5 large.

The amount of Chrysamine G binding is linear with peptide concentration over the range employed, as shown in Figure 5.

Kinetics of Binding

10 Kinetic studies showed a fairly rapid association (Figure 6A), essentially complete by 1 min, at a [Chrysamine G] = $112\mu M$ with a $t_{\frac{1}{2}}$ of 8.9 ± 1.8 sec and a somewhat less rapid dissociation (Figure 6C), $t_{\frac{1}{2}} = 55 \pm 9.4$ sec [dissociation rate constant (k_{-1}) = 1.26×10^{-2} sec $^{-1}$]. Figure 6B shows a transformation of the 15 association kinetic data according to the method of Bennett and Yamamura. Bennett, J.P. and Yamamura, H.I. in NEUROTRANSMITTER RECEPTOR BINDING (N.Y.: Raven Press 1985) pp. 61-89. The linear portion of the association 20 curve in Figure 6A is transformed into the line of Figure 6B, in which $\ln[B_{eq}/(B_{eq}-B_t)]$ is plotted versus time, where B_{eq} is the amount of Chrysamine G bound at equilibrium (4 min) and B_t is the amount bound at time=t. The slope of this line equals $k_{observed}$ and 25 $k_1 = (k_{observed} - k_{-1}) / [\text{Chrysamine G}]$, where k_{-1} is the dissociation rate constant determined from the data in

- 94 -

Figure 6C. The curve in Figure 6C follows the equation:

$$A_t = A_0 e^{-k_{-1}t}$$

where A_t is the amount of Chrysamine G remaining bound at time=t, A_0 is the amount of Chrysamine G bound at time=0, t is the time in min, and k_{-1} is the dissociation rate constant. From this analysis, the association rate constant (k_1) is calculated to be $3.75 \times 10^4 \text{ M}^{-1} \text{ sec}^{-1}$ giving a $K_b = k_1/k_{-1} = 0.34 \mu\text{M}$, in good agreement with the Scatchard analysis.

10 Chrysamine G Derivatives Can Inhibit the Binding
of Chrysamine G to A β

15 K_i values for the inhibition of [¹⁴C]Chrysamine G binding to A β (10-43) by the Chrysamine G analogues are shown under the chemical structures in Figure 1 and several displacement curves are shown in Figure 3. K_i is defined as $IC_{50}/(1+[L]/K_b)$, where [L] is the concentration of [¹⁴C]Chrysamine G in the assay (.100-.125 μM) and K_b is 0.26 μM , the K_b of Chrysamine G determined by the Scatchard analysis above. Chrysamine G itself gives a K_i of $0.37 \pm 0.04 \mu\text{M}$, a value very consistent with those obtained from the Scatchard and kinetic analyses. Congo red gives a K_i of $2.82 \pm 0.84 \mu\text{M}$. The difluoro derivative of Chrysamine G, (5-FSA)CG, (Figure 1) is one-third as potent as Chrysamine G itself (K_i = $1.16 \pm 0.19 \mu\text{M}$). The activity of the

difluoro Chrysamine G derivative suggests that an ¹⁸F difluoro Chrysamine G derivative works for PET imaging and an ¹⁹F difluoro Chrysamine G derivative works for MRS/MRI imaging of brain.

5 The 3-ICG is slightly more potent than Chrysamine G. The activity of the 3-ICG derivative suggests that an ¹²³I difluoro Chrysamine G derivative works for SPECT imaging. Methylating the phenol of 3-ICG decreases the affinity by a factor of 10 in 3-IGC(OMe)₂. Methylating 10 the carboxylate group effected an even greater (about 200-fold) decrease in affinity in CG(COOMe)₂. Removing the acid moiety entirely, as in the phenol derivative, completely destroyed binding affinity.

15 These results suggest that the acid moiety of Chrysamine G analogues plays the major role in binding to A β and that the phenol moiety plays a facilitating role. The effect of the phenol could occur through hydrogen bonding to the acid which could serve to stabilize the structural orientation of the acid 20 moiety. The presence of a phenol in the ortho position could also alter the charge distribution of the acid either through hydrogen bonding or through changes in the charge distribution of the aromatic system as a whole. Alternatively, the phenol could directly 25 participate in binding to the amyloid via a bi-dentate attachment of both the phenol and the acid to the amyloid binding site. Adding a second phenol ortho to the carboxylate as in the resorcylic acid derivative,

-96-

(6-OHSA)CG, produces the highest affinity compound in this series having a K_i of $0.094 \pm .02 \mu\text{M}$.

Increasing the lipophilicity of the biphenyl backbone appears to increase the affinity somewhat.

5 The di-halo derivatives, 3,3'-I₂CG, 3,3'-Br₂CG, and 3,3'-Cl₂CG, all have very similar K_i values which are about half that of Chrysamine G.

Distorting the dihedral angle between the phenyl rings of the biphenyl group by substitution at the 2-position markedly diminishes affinity. This is demonstrated by the inactivity of the 2,2'-di-sulfonic acid derivative of Chrysamine G, 2,2'-(SO₃)₂CG. Since the 3,3' di-carboxylic derivative, 3,3'-(COOH)₂CG, shows only a 7-fold loss of activity from Chrysamine G, it is unlikely that the additional acidic moieties are the sole cause for the loss of activity in the 2,2'-disulfonic acid. This 2,2'- derivative is unique in that the bulky sulfonate groups in the 2-position force the biphenyl group out of planarity. Molecular modelling studies showed that the dihedral angle between the two biphenyl benzene rings in the 2,2'-disulfonic acid derivative is 83°. This angle is approximately 35-40° in Chrysamine G and all of the other active derivatives.

25 In an attempt to explore the importance of the bidentate nature of the functional groups of Chrysamine G, the binding of an aniline derivative which represents one-half of a Chrysamine G molecule (Figure

-97-

1) was studied. An approximation of the energy of binding can be calculated from the equation:

$$\Delta G = -RT \ln K_{eq}$$

where ΔG is the energy of the binding reaction, R is the molar gas constant [8.31441 J/(mole \cdot °K)], T is temperature in °K and K_{eq} is the equilibrium constant for the reaction:

and $K_{eq} = 1/K_D = 1/K_1$. Using the value of $0.26\mu\text{M}$ for the K_D of Chrysamine G, the energy of binding is roughly 38 KJ/mole. If the aniline derivative binds with one-half of this energy, the expected energy of binding would be about 19 KJ/mole. From the K_1 of $73\mu\text{M}$ for the aniline derivative, the energy of binding is 23 KJ/mole which is in acceptable agreement with the predicted value.

The importance of the hydrophobic region of Chrysamine G and the aniline derivative is demonstrated by the total lack of binding activity of salicylic acid itself.

The affinity of Chrysamine G for A β appears to be several fold greater than the affinity of Congo red for this peptide. The binding is reversible with a dissociation constant of approximately 250-400 nM, whether measured by Scatchard analysis, kinetic methods, or inhibition of binding. Owing to the non-crystalline, poorly soluble nature of amyloid fibrils, the structure of Congo red or Chrysamine G complexes

-98-

with amyloid has never been defined by precise structural techniques such as x-ray crystallography or multi-dimensional NMR. Models of Congo red interactions with amyloid have been proposed. Cooper,
5 *Lab. Invest.* 31: 232 (1974); Romhanyi, *Virchows Arch.* 354: 209 (1971). This work suggests that Congo red does not bind to a single amyloid peptide molecule, but binds across several A β molecules oriented by virtue of the beta-sheet fibril. Klunk et al., *J. Histochem.*
10 *Cytochem.* 37: 1273 (1989).

Figure 7 shows a schematic of this model, generated using MacroModel 2.5, in which Chrysamine G spans 5 peptide chains in an anti-parallel beta-sheet conformation. The peptides are used without further
15 structural refinement. The peptides are aligned so that alternate chains were spaced 4.76 Å apart, characteristic of beta-sheet fibrils. Alternate peptide chains are drawn in black and white.
Chrysamine G (black) is energy minimized and aligned
20 with the fibril model to maximize contact with lysine-16 (light grey ovals in top figure) and the hydrophobic phenylalanine 19/20 region (bottom). The two views are of the same model at approximately 90° from one another. The white arrows indicate the direction taken
25 to obtain the alternate view.

The 19.1 Å spacing between the carboxylic acid moieties of Chrysamine G matches well with the distance of 19.0 Å across the 5 chains (4 x 4.76 Å between

adjacent chains shown by Kirschner et al., *Proc. Natl. Acad. Sci. U.S.A.* 83: 503 (1986)). If the native structure of A β involves a hairpin loop structure as Hilbich et al., suggest (Hilbich et al., *J. Mol. Biol.* 218: 149 (1991)), then chains 1 and 2, 3 and 4, 5 and 6, etc., would be folded halves of the same molecule, but the model would otherwise be the same. Also important to note is the necessity for positively charged amino acid residues in this model, such as 10 lysine-16 in A β . Previous work has shown that Congo red binding correlates well with the number of positively charged amino acids in a sample of amyloid fibrils. Klunk et al., *J. Histochem. Cytochem.* 37: 1273 (1989). The bidentate nature of the model in 15 Figure 7 and the importance of hydrophobic interactions is supported by the decrease in affinity of the mono-dentate aniline analogue of Chrysamine G and the inactivity of salicylic acid as well as the increased potency of the more lipophilic compounds having two 20 halogens on the benzidine moiety (see Figure 1). The importance of the nearly planar biphenyl group is suggested by the inactivity of the 2,2'-disulfonic acid derivative.

-100-

**EXAMPLE 3. CHRYSAMINE G DISTINGUISHES ALZHEIMER'S
DISEASE BRAIN FROM NORMAL BRAIN**

**Characterization of the Binding of
Chrysamine G to AD Brain**

5 Scatchard analyses of the binding of Chrysamine G and Chrysamine G derivatives to AD brain samples were performed in an effort to understand the increased binding of Chrysamine G to AD brain. (Figure 4B, Table 1). Under the conditions employed, control and AD 10 brain showed a single binding component. The K_b in AD brain was 16% lower than control but the difference was not significant ($p=.29$). The B_{max} in AD brain was 36% higher than the B_{max} in control brain, but, again, the difference did not reach significance ($p=.09$). 15 Therefore, the increased binding in AD brain appears to be mainly due to the presence of more of the same binding component which exists in control brain, rather than the presence of a unique component.

20 **Table 1. Comparison of binding Parameters in AD and control brain**

	K_b (μM)	B_{max} (pmol/ μg prot)
Control (n=6)	$0.47 \pm .049$	$0.576 \pm .092$
AD(n=5)	$0.39 \pm .048$	$0.784 \pm .061$

-101-

The binding of CG to AD brain significantly correlated with numbers of NPs in the association cortices of the brain. Figure 8A shows the correlation of [¹⁴C]CG binding with numbers of NPs in the 5 superior/middle frontal and superior temporal cortex of AD brain. The correlation with NPs was significant whether controls were included ($r=0.69$; $p=0.001$) or if the AD brains were considered alone ($r=0.59$; $p=0.007$). Figure 8B shows a similar correlation with NFT counts. 10 As with NPs, the correlation with NFTs was significant whether controls were included ($r=0.60$; $p=0.001$) or if the AD brains were considered alone ($r=0.50$; $p=0.026$). The correlation with NFTs is not surprising since CG is 15 a derivative of Congo red, which stains NFTs. The number of NPs was significantly correlated with the number of NFTs ($r=0.82$; $p=.0001$).

Only qualitative data on the presence or absence of amyloid angiopathy was available for the brains used in this study, so similar correlations could not be 20 performed between CG binding and cerebrovascular amyloid levels. The presence of amyloid angiopathy does appear to be a confounding variable in the correlation of CG binding with NP counts. Figure 8A shows the improved correlation of CG binding to NP 25 counts in brains without amyloid angiopathy ($r=0.79$; $p=0.01$) compared to those brains with cerebrovascular amyloid deposits ($r=0.49$; $p=0.15$). A similar

-102-

improvement was not found in the correlation to NFT counts.

The K_b for [^{14}C] Chrysamine G binding to AD brain is similar to that found for [^{14}C] Chrysamine G binding 5 to synthetic A β in vitro, suggesting that binding in brain homogenates also may represent interaction with A β . The correlation of Chrysamine G binding to NFTs may indicate that Chrysamine G binds to these structures in brain homogenates as well.
10 Alternatively, since the number of NFTs correlates closely with the number of NPs, the correlation of [^{14}C] Chrysamine G binding to NFTs may just be an epiphenomenon of Chrysamine G binding to NPs.

The useful Chrysamine G derivatives or analogues 15 provided herein have binding affinities that are at least in the range of 0.01 to 10.0 μM K_b , as measured by binding to either synthetic A β peptide or Alzheimer's Disease brain tissue; higher affinity compounds having binding affinities in the range of 20 0.0001 to 0.01 μM are also useful in the method of the present invention.

Considering the above, Chrysamine G binding may 25 not be specific for A β . Instead, Chrysamine G binding may reflect the total amyloid "load" of the brain, comprised of aggregated deposits of A β in neuritic plaques and cerebrovascular amyloid. Deposits of phosphorylated tau protein in NFTs may contribute to Chrysamine G binding as well. Goedert, M. et al., PNAS

-103-

85: 4051 (1988). NFTs also are composed of anti-parallel beta-sheet fibrils similar in quaternary structure to fibrils of A β . Kirschner et al., Proc. Natl. Acad. Sci. U.S.A. 83: 503 (1986).

5 **Total and Relative Chrysamine G Binding Distinguishes AD From Normal Brain**

In vitro binding assays such as those described above and below are widely used in the art as models to screen compounds for in vivo binding in brain and to predict success in subsequent in vivo imaging studies.

10 See, Young, A. et al., Receptor Assays: In Vitro and In Vivo. in POSITRON EMISSION TOMOGRAPHY AND AUTORADIOGRAPHY (Phelps, M., Mazziota, J., and Schelbert, H. eds.) pp. 73-111 (1986). The labeled Chrysamine G and Chrysamine G derivatives of the invention also may be used in the in vitro binding assays described above and below to quantitate amyloid deposits in biopsy or post-mortem specimens.

15 Saturable (specific) binding of [^{14}C] Chrysamine G was observed both in AD brain and control brain homogenates and constituted 60-80% of total binding in AD brain. Non-saturable binding was very similar in AD and control brain. Both saturable and total binding were greater in AD brain than in control. Despite the lower sensitivity obtained when using total binding, this parameter is more predictive of success in in vivo studies which are the ultimate goal of this invention.

-104-

Also for the purpose of extension to *in vivo* studies, it is advantageous if Chrysamine G binding in cortical areas is normalized to a brain area in which Chrysamine G binding is very similar in both AD and control brain.

5 This obviates the need to calculate the absolute quantity bound which is difficult to do *in vivo*. We examined binding in the cerebellum as a potential control area because classical NPs are exceedingly rare in this brain area (Joachim et al., Am. J. Pathol. 135: 10 309 (1989)).

The average amount of [¹⁴C]Chrysamine G bound to control cerebellum is nearly identical to the amount bound to AD cerebellum (Table 2), supporting the use of cerebellum as an internal control. Therefore, the 15 cerebellar ratio (CBR) accurately reflects the absolute quantity of [¹⁴C]Chrysamine G bound and offers the advantage of providing an internal control for each brain. Binding is greater in AD brain whether expressed in absolute terms of fmol/ μ g protein (Table 20 2) or as a ratio to the binding in the cerebellum of the same brain (Table 3). The CBR is the more sensitive measure and shows less variability between brains. The use of total binding and CBRs greatly facilitates extension of these *ex vivo* results to *in vivo* studies. Accordingly, the results below are 25 expressed in these terms whenever appropriate.

-105-

Table 2. Comparison of total binding in AD and control brain*.

Brain Area	Control (fmol/ μ g protein)	AD (fmol/ μ g protein)	p Value
Cerebellum	75 \pm 13 (n=8)	73 \pm 9 (n=11)	p=0.91
Frontal Pole	58 \pm 8 (n=6)	124 \pm 16 (n=10)	p<0.006
Superior/Middle Frontal	54 \pm 10 (n=8)	130 \pm 21 (n=11)	p<0.005
Superior Temporal	66 \pm 17 (n=8)	121 \pm 14 (n=11)	p<0.02
Head of Caudate	73 \pm 11 (n=4)	123 \pm 22 (n=7)	p=0.14
Inferior Parietal	76 \pm 13 (n=8)	137 \pm 19 (n=11)	p<0.03
Occipital	64 \pm 16 (n=8)	95 \pm 12 (n=11)	p=0.15

*High- and low-plaque AD brains combined.

-106-

Table 3. Comparison of total binding in AD and control brain as a ratio to cerebellum*.

Brain Area	Control (CBR)	AD (CBR)	p Value
Frontal Pole	0.87 ± .04 (n=6)	1.87 ± .25 (n=10)	p<0.004
Superior/Middle Frontal	0.73 ± .02 (n=8)	1.84 ± .18 (n=11)	p<0.001
Superior Temporal	0.86 ± .08 (n=8)	1.63 ± .17 (n=11)	p<0.002
Head of Caudate	0.95 ± .04 (n=4)	1.76 ± .31 (n=7)	p<0.04
Inferior Parietal	0.90 ± .08 (n=8)	1.93 ± .20 (n=11)	p<0.001
Occipital	0.77 ± .13 (n=8)	1.44 ± .20 (n=11)	p<0.02

*The CBR for each sample is obtained by dividing the absolute value of [¹⁴C]Chrysamine G binding in that sample by the absolute value of [¹⁴C]Chrysamine G binding in the cerebellar sample from that same brain. The values in the table are the average CBRs from each brain area (± SEM). High- and low-plaque AD brains combined.

Figure 9A and 9B shows the binding of [¹⁴C]Chrysamine G to six brain areas normalized to the cerebellum of the same brain. The binding of Chrysamine G to AD brain areas in AD brains having more than 20 NPs/x200 magnification, "High Plaque AD

-107-

Brains", is shown in Figure 9A. The binding of Chrysamine G to AD brain areas in AD brains having less than 20 NPs/x200 magnification, "Low Plaque AD Brains", is shown in Figure 9B. In all brain areas, the binding to AD brain is significantly greater than the binding to control (see Table 3). In superior/middle frontal cortex, there is no overlap between control and any of the AD samples. In all brain areas except the occipital cortex, there is no overlap between control and the AD samples having >20 NPs/x200 magnification. In brain areas with the least deposition of classical NPs, such as the occipital cortex (and cerebellum), the greatest overlap between AD and control was observed.

Figure 9C shows the data from two patients who had Down's syndrome. Down's syndrome patients all develop deposits of A β by their fourth decade and many develop AD. Wisniewski et al., Neurology 35: 957 (1985); Schapiro et al., Neurobiol. Aging 13, 723 (1992). Both of these patients showed [^{14}C]Chrysamine G binding above the control range. Since the younger patient (23 years old) had amyloid deposits but was not yet clinically demented, Figure 9C suggests that Chrysamine G can detect differences from control in non-demented patients destined to develop AD long before the dementia is clinically evident.

The compounds and method of the invention provide two useful measurements for differentiating AD brain from normal brain; either (1) total Chrysamine G

-108-

binding (Table 2) or (2) the ratio of Chrysamine G binding in a given brain area to binding in the cerebellum of the same brain (Table 3). These measurements furnish two great advantages for in vivo quantitation of AD neuritic plaques. First, by providing a means to measure total A β binding, rather than specific A β binding, the instant invention can quantify A β deposition without having to expose the subject to a second injection of radioactive material in order to measure non-specific binding. Because of this, the data are expressed as total binding only. In all of the experiments presented, specific binding data yields even greater differences between AD and control brain.

Second, variations in brain uptake of Chrysamine G derivatives will affect the absolute concentration of Chrysamine G in brain. Some mechanism will be necessary, therefore, to account for these variations between subjects. Each patient can serve as his/her own control by finding a brain area that shows little A β deposition (i.e., an experimental "blank"). Since classical NPs are exceedingly rare in the cerebellum (Joachim et al., Am. J. Pathol. 135: 309 (1989)), Chrysamine G binding to the cerebellum was used as a control for each brain studied. The results were expressed in terms of the ratio of Chrysamine G binding in a given brain area to binding in the cerebellum of the same brain (Figure 9 and Table 3).

-109-

For the purposes of *in vivo* quantitation of amyloid in AD, the effect of brain atrophy should be considered. Therefore, when using the Chrysamine G and Chrysamine G derivative probes *in vivo* to quantitate amyloid, brain atrophy can be corrected based on MRI volume measurements. MRI volume measurements performed in conjunction with the method of the invention are analogous to those routinely employed in the art. See, Pearlson, G. and Marsh, L. MAGNETIC RESONANCE IMAGING IN PSYCHIATRY in *Annual Review of Psychiatry* (Vol. 12) Oldham, J. et al., eds. p. 347-381 (1993). Therefore a method for determining the total radioactivity per volume of brain area would use the following equation:

15 total SPECT or PET signal from brain area "A"
 MRI determined brain volume
 (excluding CSF) in brain area "A"

Designating this measurement as the signal/volume for brain area "A" or S/V_A means that the cerebellar ratio would be expressed as:

20
$$\text{Ratio}_A = \frac{S/V_A}{S/V_{CB}}$$

where S/V_{CB} is the signal/volume in the cerebellum of the same subject during the same imaging study. This ratio from any brain area other than cerebellum from a patient suspected of having AD or other pathological

-110-

condition characterized by the deposition of amyloid could then be compared to the normal range of the analogous ratio from the same brain area of a group of age-matched normal control subjects. The ratio of the 5 binding to brain areas with high deposits of neuritic plaques to the cerebellum can be used as the parameter to distinguish Alzheimer from control subjects.

EXAMPLE 4 THE OCTANOL-WATER PARTITION COEFFICIENTS
OF CHRYSAMINE G, CHRYSAMINE G
DERIVATIVES, AND CONGO RED

The octanol-water partition coefficient is a measure of the relative lipophilicity of a compound. The more lipophilic a compound, the more likely it is to cross the blood-brain barrier. See, Goodman and Gilman's THE PHARMACOLOGICAL BASIS FOR THERAPEUTICS (7th Ed.). The octanol/water partition coefficient of Chrysamine G is 60.22 ± 3.97 and that of Congo red is 0.665 ± 0.037 ($p < 0.001$). This suggests that Chrysamine G is approximately 90 times more lipophilic than Congo red and therefore is theoretically more likely to cross the mammalian blood-brain barrier. The octanol/water partition coefficients for the 3-iodo and 3,3'-diiodo derivatives of Chrysamine G (Figure 1) are $72.53 \pm .74$ and 112.9 ± 7.3 , respectively. These octanol/water partition coefficients show that these derivatives, 20 which are non-radioactive analogues of some of the 25

-111-

radiolabeled Chrysamine G derivatives to be used for *in vivo* studies, are up to 170 times more lipophilic than Congo red and up to twice as lipophilic as Chrysamine G. This suggests they will enter the brain much better
5 than either Congo red or Chrysamine G.

10

**EXAMPLE 5 THE ABILITY OF CHRYSAMINE G AND
CHRYSAMINE G DERIVATIVES TO CROSS THE
BLOOD-BRAIN BARRIER AND METABOLISM OF
CHRYSAMINE G**

Use of the amyloid probes to diagnose AD *in vivo* requires them to be able to cross the blood-brain barrier and gain access to parenchymal amyloid deposits.

15

The ability of Chrysamine G to cross the blood-brain barrier was studied in Swiss-Webster mice. After i.v. injection, the brain/blood ratio measured at 15 min was over 10:1 and approached 20:1 by 35 min (Figure 10). The radioactivity in brain stayed nearly constant over this period, but decreased in the blood and increased in the liver. The brain/kidney ratio was highest at 15 min (over the time points sampled) and approached 0.5. When brain and liver were extracted 60 min after i.v. injection of [¹⁴C]Chrysamine G, >95% of the recovered radioactivity co-eluted with authentic Chrysamine G on reverse phase HPLC, indicating no significant metabolism of Chrysamine G over this period of time.

-112-

Chrysamine G does get into normal mouse brain, and the brain/blood ratio is high. The radioactivity in brain remained relatively constant over the first 30 min while decreasing in blood and increasing in liver.

5 This suggests that the high brain/blood ratio is more a result of efficient removal of Chrysamine G from the blood by the liver than to further accumulation in the brain. At 60 min, essentially all of the radioactivity found in the brain and liver proved to be unchanged

10 Chrysamine G. Congo red does not cross the blood-brain barrier well. Tubis et al., J. Amer. Pharm. Assn. 49: 422 (1960). Most of the Congo red is cleared by the liver and spleen and the brain/kidney ratio achieved in guinea pigs is approximately 0.07. Tubis et al.,

15 supra. Chrysamine G also is cleared by the liver, but has greater entry into the brain.

In vivo animal testing provides yet a further basis for determining dosage ranges, efficacy of transfer through the blood barrier and binding ability.

20 Particularly preferred for this purpose are the transgenic mouse model of Games et al., (Nature 373: 523 (1995)) and the "senile animal" model for cerebral amyloidosis; i.e., animals such as the transgenic mice or aged dogs or monkeys, which are known to develop variable numbers of Alzheimer-type cerebral neuritic plaques, see Wisniewski et al., J. Neuropathol. & Exp. Neurol. 32: 566 (1973), Selkoe et al., Science 235: 873 (1987), are tested for binding and detection efficacy.

-113-

This *in vivo* assay requires control-biopsy or necropsy monitoring to confirm and quantify the presence of amyloid deposits.

Other suitable animal models for use in testing
5 the compositions and methods of the present invention
are produced transgenically. For instance, Quon et
al., *Nature*, 352: 239-241 (1991) used rat neural-
specific enolase promoter inhibitor domain to prepare
transgenic mice. See also, Wirak et al., *Science*, 253:
10 323-325 (1991). Still other models have been produced
by Intracranial administration of the β /A4 peptide
directly to animals (Tate et al., *Bull. Clin.
Neurosci.*, 56: 131-139 (1991)).

It is noted that none of the *in vivo* animal models
15 may turn out to be extremely good models for AD
neuropathology. Instead, they may more closely model
the amyloid deposition of normal aging. This is
particularly true of the aged-mammal models. All of
these models show a preponderance of diffuse plaques as
20 discussed above for the aged dog model. While there is
some cerebrovascular amyloid, there are few neuritic
plaques, except in the Games et al., transgenic mouse
model. The other transgenic mouse models often show
only diffuse plaques. Therefore, while these models
25 may be useful for studying distribution of the probes
in the brain, there is a fairly low probability that
these models would show the same quantitative
differences that would be expected to be seen in AD

-114-

brain based on the in vitro studies of Chrysamine G binding to AD brain described above.

Evaluating the Ability of Chrysamine G Derivatives to Cross the Human Blood-Brain Barrier

5 A dose of approximately 10 mCi of an appropriately radiolabeled derivative of Chrysamine G with a specific activity of approximately 500 Ci/mole or higher is injected intravenously into normal subjects and patients suspected of having AD and monitored by SPECT or PET imaging to analyze the detectability of the derivative in brain relative to other organs and to define the time course of detectability in the brain. A dose which can be reliably detected is defined as a "imaging effective dose."

15 **Evaluation of Chrysamine G and Chrysamine G Derivatives to Distinguish AD from Age-Matched Controls in Humans**

20 An imaging-effective dose of an appropriately, radioactively labeled derivative of Chrysamine G is injected into a subject suspected of having brain amyloid deposition due to pathological conditions such as AD. After a period of 15 minutes to 24 hours, the radioactive signal from brain is detected by SPECT or PET. Radioactivity is simultaneously detected in all 25 brain areas included in the field of view of the detector. This field of view will be set up so as to include large portions of the cerebellum, superior

-115-

temporal cortex, superior/middle frontal cortex, and intervening brain regions. An MRI scan will be performed prior to the study so that corrections can be made for brain atrophy in the areas of interest by methods discussed in Example 3. The S/V_A, S/V_{ca}, and Ratio_A variables discussed in Example 3 will be calculated and compared to analogous normative ratios obtained previously from age-matched normal control subjects.

10 EXAMPLE 6 HISTOLOGIC LOCALIZATION OF CHRYSAMINE G
BINDING TO CEREBROVASCULAR AMYLOID

The top frame of Figure 11 demonstrates two neuritic plaques stained by Chrysamine G. The staining method was that of Stokes and Trickey, J. Clin. Pathol. 15 26: 241-242 (1973) with Chrysamine G substituted for Congo red. Except for somewhat lower intensity, these deposits are identical to those stained with Congo red (not shown). The bottom two frames of the photomicrograph in Figure 11 show adjacent sections 20 from the temporal lobe of an AD patient with amyloid angiopathy. The section in the lower left was stained with the Congo red using the method of Puchtler. Puchtler et al., J. Histochem. Cytochem. 10: 35 (1962). The section in the lower right of Figure 11 was 25 stained by substituting Chrysamine G for Congo red in the Puchtler method. Both sections readily demonstrate

-116-

the same amyloid-laden vessel. A small amount of background auto-fluorescence from erythrocytes and lipofuscin also is visible. Both photomicrographs were obtained with a laser confocal microscope using fluorescein isothiocyanate (FITC) filters. The bar represents 20 microns.

EXAMPLE 7 ASSESSING THE TOXICITY OF
CHRYSAMINE G AND CHRYSAMINE G
DERIVATIVES

At doses of 10 and 100 mg/kg non-radioactive Chrysamine G administered intraperitoneally, no notable behavioral effects or toxicity were observed in mice for periods up to 72 hrs. The doses of [¹⁴C]Chrysamine G administered were on the order of 1 mg/kg.

Chrysamine G appeared to show little acute toxicity based on attempts to establish an LD₅₀. Even when the maximum volume that can be injected into a mouse without harming it just from fluid volume effects (approx. 0.025 ml/g) of a saturated solution of Chrysamine G was injected into mice (100 mg/kg), there were no behavioral changes noted for at least 72 hrs, the longest period tested. Doses required for detection of radiolabeled derivatives by SPECT or PET would be orders of magnitude below this dose.

Congo red has been safely injected into humans in quantities much greater than would be used for the

-117-

radioactive Chrysamine G derivatives. The LD₅₀ for Congo red has been shown to be 190 mg/kg mouse (Tubis et al., J. Amer. Pharm. Assoc. 49: 422 (1960)), which is similar to the >100 mg/kg LD₅₀ shown for Chrysamine 5 G. Thus, these two chemically similar compounds cause similar low toxicities in mice.

Other Chrysamine G derivatives can similarly be tested for toxicity in mice and other higher mammals by injecting a wide range of concentrations and studying 10 the animals for various signs of toxicity by methods well known in the art. See, Goodman and Gilman's THE PHARMACOLOGICAL BASIS FOR THERAPEUTICS (7th Ed.).

EXAMPLE 8 ASSESSING THE ABILITY OF CHRYSAMINE G TO
PROTECT AGAINST A_B (25-35)-INDUCED
TOXICITY

15 Protection from A_B (25-35)-induced Toxicity in PC-12 cells

Rat pheochromocytoma cells (PC-12) were grown in RPMI 1640 media with 10% fetal bovine serum. 20 Approximately 5,000 exponentially growing cells were plated in 96-well plates in a volume of 100 μ l of media and allowed to incubate at 37°C overnight. The A_B (25-35), which had been pre-aggregated at 37°C for 7 days, was pre-incubated with Chrysamine G (CG) or related 25 compounds in aqueous solution prior to addition of 20 μ l to achieve the final concentrations given (0.01 to 10 μ M A_B(25-35) and 0.03 to 20 μ M CG). The cells were

-118-

incubated for 24 hrs prior to the addition of 13.3 μ l
of 5 mg/ml MTT (3, (4,5-dimethylthiazol-2-yl)2,5-
diphenyltetrazolium bromide) in sterile phosphate
buffered saline. After 4.5 hrs at 37°C, 100 μ l of
5 extraction buffer (20% w/v SDS in 50% DMF/water; pH
adjusted to 4.7 with 2.5% of 80% acetic acid and 2.5%
1N HCl) was added and the plates were incubated
overnight. Hansen et al., *J. Immunol. Methods* 119:
203 (1989). Color development was then measured at 560
10 nm. Maximum viability was defined as the absorbance of
control wells to which only the 20 μ l of distilled,
deionized H₂O was added. Maximum toxicity was defined
by wells in which the cells were lysed by addition of
0.1% (final concentration) of Triton X-100.

15 Incubation of PC12 cells with A β (25-35) results in
a concentration-dependent decrease in the ability of
these cells to reduce MTT (Figure 12). Figure 12 shows
the effect of increasing concentrations of A β (25-35) in
the presence and absence of Chrysamine G on the
20 cellular redox activity of PC12 cells as measured by
MTT reduction. The reduction product of MTT absorbs at
560 nm which is plotted on the vertical axis. The
effect of A β (25-35) alone is shown in the filled bars
and shows a dose dependent decrease in MTT reduction.
25 Significant differences from control (no A β , no
Chrysamine G) are shown in white numbers inside the
filled bars. The protective effect of 20 μ M Chrysamine
G is shown in the open bars. Significant differences

-119-

between MTT reduction in the presence and absence of Chrysamine G are shown in black numbers inside the open bars.

Figure 13 demonstrates the protective effect of increasing concentrations of Chrysamine G against the A β (25-35)-induced reduction of cellular redox activity of PC12 cells. The effect of Chrysamine G in the absence of A β (25-35) is shown in the filled bars. There was no significant difference between control (no A β , no Chrysamine G) and any of the concentrations of Chrysamine G in the absence of A β (25-35). MTT reduction in the presence of 1 μ M A β (25-35) and increasing concentrations of Chrysamine G is shown in the open bars. Significant differences in MTT reduction between the presence and absence of A β (25-35) at each concentration of Chrysamine G are shown in white numbers inside the filled bars. Significant differences in MTT reduction between the A β (25-35) control (no Chrysamine G) and A β (25-35) plus increasing concentrations of Chrysamine G are shown in black numbers inside the open bars.

As has previously been reported, Congo red protects against the A β -induced toxicity at concentrations over 2 μ M, achieving complete protection by 20 μ M. Burgevin et al. NeuroReport 5: 2429 (1994); Lorenzo and Yankner, Proc. Natl. Acad. Sci. 91: 12243 (1994); Pollack et al., Neuroscience Letters 184: 113 (1995); Pollack et al. Neuroscience Letters 197: 211

-120-

(1995). Chrysamine G shows a protective effect which is dependent on both the concentration of A β (25-35) (Figure 12) as well as the concentration of Chrysamine G (Figure 13). The protective effect of Chrysamine G is evident at 0.2 μ M, a concentration very close to the Ki of Chrysamine G for binding to synthetic A β , 0.37 μ M (Figure 1). Chrysamine G appears to be more potent than Congo red, showing effects in the range of 0.1 to 1.0 μ M. This is consistent with the Ki values for binding to synthetic A β of 0.37 μ M for Chrysamine G and 2.8 μ M for Congo red (Figure 1).

In another experiment (Figure 14), the effect of Chrysamine G and the phenol derivative (see Figure 1), which does not bind A β , was examined in cells incubated with 1 μ M A β (25-35). Chrysamine G showed protective effects at 0.1 and 1 μ M, but the phenol derivative showed no protective effects, and perhaps enhanced the toxicity of A β .

These results suggest that the lipophilic derivative of Congo red, Chrysamine G, prevents A β -induced cytotoxicity in cell culture at concentrations very similar to those at which it binds A β . This protection shows structural specificity since the phenol derivative which does not bind to synthetic A β also does not prevent A β -induced cytotoxicity. Since Chrysamine G partitions into the brain well, these results provide evidence that Chrysamine G and A β -

-121-

binding derivatives of Chrysamine G have therapeutic potential in the treatment of AD.

The mechanism of the protective effect of Chrysamine G is unknown at present. Two broad 5 possibilities exist. First, Chrysamine G could interfere with the aggregation of A β . Second, Chrysamine G could interfere with the effects (direct or indirect) of A β on the target cells. Congo red does inhibit aggregation of A β as well as protect against 10 the toxic effects of aggregated A β . Lorenzo and Yankner, Proc. Natl. Acad. Sci. 91: 12243 (1994). Interference with aggregation is unlikely in the above experiment since the A β was pre-aggregated prior to 15 incubation with Chrysamine G. Thus, inhibition of aggregation could prove to be an important therapeutic effect of Chrysamine G but is not a likely explanation for the protective effects of Chrysamine G against pre-aggregated A β . The model of Chrysamine G binding to A β described in Figure 7, displays how Chrysamine G could 20 "coat" the surface of A β . This may change how the fibrillar deposits are recognized by cell-surface receptors or other macromolecules such as complement proteins and interfere with the toxic effects of A β which may be mediated by these macromolecules. It is 25 likely that Chrysamine G and Congo red exert multiple effects, both before and after the aggregation of A β . This is advantageous from a therapeutic point of view since patients are likely to present at a time when

-122-

there are pre-existing A β aggregates as well as ongoing amyloid deposition.

Other embodiments of the invention will be apparent to those skilled in the art from consideration 5 of the specification and practice of the invention. It is intended that the specification be considered as exemplary only, with the true scope and spirit of the invention being indicated by the following claims.

-123-

What Is Claimed Is:

1. An amyloid binding compound of Formula I or a water soluble, non-toxic salt thereof:

(I)

5 wherein:

$\text{Z} \circ \text{Z} \circ \text{Q}$ is either $\text{N}=\text{N}-\text{Q}$, $\text{CR}'=\text{N}-\text{Q}$, $\text{N}=\text{CR}'-\text{Q}$, $\text{CR}'_2-\text{NR}'-\text{Q}$, $\text{NR}'-\text{CR}'_2-\text{Q}$, $(\text{CO})-\text{NR}'-\text{Q}$, $\text{NR}'-(\text{CO})-\text{Q}$ or $\text{NR}'-\text{NR}'-\text{Q}$ (where R' represents H or a lower alkyl group);

X is $\text{C}(\text{R}'')_2$,

- 10 (wherein each R'' independently is H, F, Cl, Br, I, a lower alkyl group, $(\text{CH}_2)_n\text{OR}'$ where $n=1$, 2, or 3, CF_3 , $\text{CH}_2-\text{CH}_2\text{F}$, $\text{O}-\text{CH}_2-\text{CH}_2\text{F}$, $\text{CH}_2-\text{CH}_2-\text{CH}_2\text{F}$, $\text{O}-\text{CH}_2-\text{CH}_2-\text{CH}_2\text{F}$, CN , $(\text{C}=\text{O})-\text{R}'$, $\text{N}(\text{R}')_2$, NO_2 , $(\text{C}=\text{O})\text{N}(\text{R}')_2$, $\text{O}(\text{CO})\text{R}'$, OR' , SR' , COOR' , R_{ph} , $\text{CR}'=\text{CR}'-\text{R}_{ph}$, $\text{CR}'_2-\text{CR}'_2-\text{R}_{ph}$ (where R_{ph} represents an unsubstituted or substituted phenyl group with the phenyl substituents being chosen from any of the non-

-124-

phenyl substituents defined for R''), a tri-alkyl tin, a tetrazole or oxadiazole of the form:

wherein R' is H or a lower alkyl group)

5 or X is CR'=CR', N=N, C=O, O, NR' (where R' represents H or a lower alkyl group), S, or SO₂;

each R₁ and R₂ independently is H, F, Cl, Br, I, a lower alkyl group, (CH₂)_nOR' where n=1, 2, or 3, CF₃, CH₂-CH₂F, O-CH₂-CH₂F, CH₂-CH₂-CH₂F, O-CH₂-CH₂-CH₂F, CN, 10 (C=O)-R', N(R')₂, NO₂, (C=O)N(R')₂, O(CO)R', OR', SR', COOR', a tri-alkyl tin, R_{ph}, CR'=CR'-R_{ph}, CR'₂-CR'₂-R_{ph} (where R_{ph} represents an unsubstituted or substituted phenyl group with the phenyl substituents being chosen from any of the non-phenyl substituents defined for R₁ and R₂), a tetrazole or oxadiazole of the form:

(wherein R' is H or a lower alkyl group), or a triazene of the form:

-125-

(wherein R₈ and R₉ are lower alkyl

groups) or

- 5 and at least one of R₂ is not H, OCH₃, CH₃, or halogen
when the compound of Formula I is a 1,4-diazobenzene
compound;

- 10 each Q is independently selected from one of the
following structures, each of which contain a
carboxylic acid or an acid-like functionality:
IA, IB, IC, ID, IE, IF and IG, wherein
IA has the following structure:

wherein:

- 15 each of R₃, R₄, R₅, R₆, or R₇, independently is
defined the same as R₁ above and, wherein at least
one of R₃, R₄, R₅, R₆, or R₇, is a hydroxy,
sulphydryl, tetrazole, oxadiazole, NO₂, or carboxy
in both Q's, and wherein at least one of R₁ or R₂

-126-

is a halogen when the compound of Formula I is a 4,4'-diazobiphenyl compound;

IB has the following structure:

(IB)

5

or

wherein:

each of R₁₀, R₁₁, R₁₂, R₁₃, R₁₄, R₁₅, or R₁₆ independently is defined the same as R₁ above, and wherein at least one of R₁₀, R₁₁, R₁₂, R₁₃, R₁₄, R₁₅ or R₁₆ is a hydroxy, sulfhydryl, tetrazole, oxadiazole, NO₂ or carboxy in both Q's, and wherein at least one of R₁, or R₂ is a halogen when the compound of Formula I is a 4,4'-diazobiphenyl compound;

15

IC has the following structure:

(IC)

-127-

wherein:

each of R_{17} , R_{18} , R_{19} , R_{20} , or R_{21} is defined the same as R_1 above;

ID has the following structure:

5

(ID)

wherein:

each of R_{22} , R_{23} , or R_{24} independently is defined the same as R_1 above

and

10

represents a heterocyclic ring of one of the six following formulas:

-128-

IE has the following structure:

wherein:

5 each of R₂₅, R₂₆, or R₂₇, independently is defined the same as R₁ above

and

represents a heterocyclic ring of one of the six following formulas:

-129-

IF has the following structure:

wherein:

5 exactly one of R_{28} , R_{29} , R_{30} , R_{31} or R_{32} is the $\text{Z} \text{ } \text{Z}$

link defined for Formula I above and each other
 R_{28} , R_{29} , R_{30} , R_{31} or R_{32} independently is defined the
 same as R_1 above, and wherein at least one of R_{28} ,
 R_{29} , R_{30} , R_{31} or R_{32} is a hydroxy, sulfhydryl,
 tetrazole, oxadiazole, NO_2 or carboxy in both Q's;

-130-

IG has the following structure:

(IG)

wherein:

5 exactly one of R_{33} , R_{34} , R_{35} , R_{36} , R_{37} , R_{38} , or R_{39} is
the $\text{Z} \bigcirc \text{Z}$ link defined for Formula I above and each
other R_{33} , R_{34} , R_{35} , R_{36} , R_{37} , R_{38} , or R_{39} , independently
is defined the same as R_1 above, and wherein at
least one of R_{33} , R_{34} , R_{35} , R_{36} , R_{37} , R_{38} , or R_{39} , is a
10 hydroxy, sulphydryl, tetrazole, oxadiazole, NO_2 or
carboxy in both Q's;

or wherein:

$\text{Z} \bigcirc \text{Z} \bigcirc \text{Q}$ is $\text{NR}'-\text{N}=\text{Q}$ (where R' represents H or a lower
alkyl group) and each $\text{Z} \bigcirc \text{Q}$ is independently selected
15 from one of the following structures:
IIA or IIB, wherein:

-131-

IIA has the following structure:

(IIA)

wherein:

each of R₄₀ - R₄₇ independently is H, F, Cl, Br, I,
 5 a lower alkyl group, (CH₂)_nOR' where n=1, 2, or 3,
 CF₃, CH₂-CH₂F, O-CH₂-CH₂F, CH₂-CH₂-CH₂F, O-CH₂-CH₂-
 CH₂F, CN, (C=O)-R', N(R')₂, NO₂, (C=O)N(R')₂,
 O(CO)R', OR', SR', COOR', R_{ph}, CR'=CR'-R_{ph}, CR'₂-
 10 CR'₂-R_{ph} (where R_{ph} represents an unsubstituted or
 substituted phenyl group with the phenyl
 substituents being chosen from any of the non-
 phenyl substituents defined for R₁), a tri-alkyl
 tin, a tetrazole or oxadiazole of the form:

15 (wherein R' is H or a lower alkyl group).

IIB has the following structure:

-132-

(IIB)

wherein:

each of R_{48} and R_{49} , independently is a lower alkyl group, $(\text{CH}_2)_n\text{OR}'$ where $n=1, 2$, or 3 , CF_3 , $\text{CH}_2\text{-CH}_2\text{F}$,
 5 $\text{CH}_2\text{-CH}_2\text{-CH}_2\text{F}$, CN , $(\text{C=O})\text{-R}'$, NO_2 , $(\text{C=O})\text{N}(\text{R}')_2$,
 COOR' , $(\text{C=O})\text{-}(\text{CH}_2)_n\text{-}(\text{C}_6\text{H}_5)$ where $n=1, 2$, or 3 , R_{ph} ,
 $\text{CR}'=\text{CR}'-\text{R}_{ph}$, $\text{CR}'_2\text{-CR}'_2\text{-R}_{ph}$ (where R_{ph} represents an unsubstituted or substituted phenyl group with the phenyl substituents being chosen from any of the
 10 non-phenyl substituents defined for R_1), a tetrazole or oxadiazole of the form:

(wherein R' is H or a lower alkyl group),

wherein at least one of R_{48} or R_{49} , is $(\text{C=O})\text{-R}'$, NO_2 ,
 15 $(\text{C=O})\text{N}(\text{R}')_2$, COOR' , CN , or a tetrazole or oxadiazole of the form:

-133-

(wherein R' is H or a lower alkyl group) in both
Q's.

-134-

2. The compound of claim 1, wherein at least one of the substituents R₁-R₇ and R₁₀-R₄, is selected from the group consisting of R_{ph}, CR'=CR'-R_{ph}, CR'₂-CR'₂-R_{ph}.

3. The compound of claim 1, wherein at least one of the substituents R₁-R₇ and R₁₀-R₄, is selected from the group consisting of ¹³¹I, ¹²³I, ⁷⁶Br, ⁷⁵Br, ¹⁸F, CH₂-CH₂-¹⁸F, O-CH₂-CH₂-¹⁸F, CH₂-CH₂-CH₂-¹⁸F, O-CH₂-CH₂-CH₂-¹⁸F, ¹⁹F, ¹²⁵I, and a carbon-containing substituent as specified in Formula I wherein at least one carbon is ¹¹C or ¹³C.

4. The compound of claim 1, wherein said compound binds to A β with a dissociation constant (K_d) between 0.0001 and 10.0 μ M when measured by binding to synthetic A β peptide or Alzheimer's Disease brain tissue.

5. A method for synthesizing a compound of claim 1, wherein at least one of the substituents R₁-R₇ and R₁₀-R₄, is selected from the group consisting of ¹³¹I, ¹²⁵I, ¹²³I, ⁷⁶Br, ⁷⁵Br, ¹⁸F and ¹⁹F, comprising the step of reacting a compound of claim 1, wherein at least one of the substituents R₁-R₇ and R₁₀-R₄, is a tri-alkyl tin, with a halogenating agent containing ¹³¹I, ¹²⁵I, ¹²³I, ⁷⁶Br, ⁷⁵Br, ¹⁸F or ¹⁹F.

-135-

6. A pharmaceutical composition for *in vivo* imaging of amyloid deposits, comprising (a) a compound of claim 3 or a salt thereof, and (b) a pharmaceutically acceptable carrier.

5

7. An *in vivo* method for detecting amyloid deposits in a subject, comprising the steps of:
(a) administering a detectable quantity of the pharmaceutical composition of claim 6, and
10 (b) detecting the binding of said compound or a salt thereof to amyloid deposit in said subject.

8. The method of claim 7, wherein said amyloid deposit is located in the brain of a subject.

9. The method of claim 7, wherein said subject is suspected of having a disease or syndrome selected from the group consisting of Alzheimer's Disease, familial Alzheimer's Disease, Down's Syndrome and homozygotes for the apolipoprotein E4 allele.

10. The method of claim 7, wherein said detecting is selected from the group consisting of gamma imaging, magnetic resonance imaging and magnetic resonance spectroscopy.

-136-

11. The method of claim 10, wherein said gamma imaging is either PET or SPECT.

12. The method of claim 7, wherein said pharmaceutical composition is administered by
5 intravenous injection.

13. The method of claim 8, wherein the ratio of
(i) binding of said compound to a brain area other than
the cerebellum to (ii) binding of said compound to the
cerebellum, in said subject, is compared to said ratio
10 in normal subjects.

14. A method of inhibiting cell degeneration and
toxicity associated with fibril formation in an
amyloidosis-associated condition, said method
comprising the step of administering to a subject
15 having or suspected of having such condition, a
pharmaceutically effective amount of Chrysamine G or a
derivative thereof.

15. The method of claim 14, wherein said
derivative of Chrysamine G is an amyloid binding
20 compound of Formula I or a water soluble, non-toxic
salt thereof:

-137-

wherein:

$\text{Z} \text{ } \text{Z} \text{ } \text{Q}$ is either $\text{N}=\text{N}-\text{Q}$, $\text{CR}'=\text{N}-\text{Q}$, $\text{N}=\text{CR}'-\text{Q}$, $\text{CR}'_2-\text{NR}'-\text{Q}$,
5 $\text{NR}'-\text{CR}'_2-\text{Q}$, $(\text{CO})-\text{NR}'-\text{Q}$, $\text{NR}'-(\text{CO})-\text{Q}$ or $\text{NR}'-\text{NR}'-\text{Q}$ (where R' represents H or a lower alkyl group);

X is $\text{C}(\text{R}'')_2$

(wherein each R'' independently is H, F, Cl, Br, I, a lower alkyl group, $(\text{CH}_2)_n\text{OR}'$ where $n=1$, 2, or 3, CF_3 , $\text{CH}_2-\text{CH}_2\text{F}$, $\text{O}-\text{CH}_2-\text{CH}_2\text{F}$, $\text{CH}_2-\text{CH}_2-\text{CH}_2\text{F}$, $\text{O}-\text{CH}_2-\text{CH}_2-$
10 CH_2F , CN, $(\text{C}=\text{O})-\text{R}'$, $\text{N}(\text{R}')_2$, NO_2 , $(\text{C}=\text{O})\text{N}(\text{R}')_2$, $\text{O}(\text{CO})\text{R}'$, OR' , SR' , COOR' , R_{ph} , $\text{CR}'=\text{CR}'-\text{R}_{ph}$, CR'_2-
15 $\text{CR}'_2-\text{R}_{ph}$ (where R_{ph} represents an unsubstituted or substituted phenyl group with the phenyl substituents being chosen from any of the non-phenyl substituents defined for R''), a tri-alkyl tin, a tetrazole or oxadiazole of the form:

-138-

wherein R' is H or a lower alkyl group)

or X is CR'=CR', N=N, C=O, O, NR' (where R' represents H or a lower alkyl group), S, or SO₂;

- 5 each R₁ and R₂ independently is H, F, Cl, Br, I, a lower alkyl group, (CH₂)_nOR' where n=1, 2, or 3, CF₃, CH₂-CH₂F, O-CH₂-CH₂F, CH₂-CH₂-CH₂F, O-CH₂-CH₂-CH₂F, CN, (C=O)-R', N(R')₂, NO₂, (C=O)N(R')₂, O(CO)R', OR', SR', COOR', a tri-alkyl tin, R_{ph}, CR'=CR'-R_{ph}, CR'₂-CR'R_{ph}
10 (where R_{ph} represents an unsubstituted or substituted phenyl group with the phenyl substituents being chosen from any of the non-phenyl substituents defined for R₁ and R₂), a tetrazole or oxadiazole of the form:

- 15 (wherein R' is H or a lower alkyl group), or a triazene of the form:

-139-

(wherein R₈ and R₉ are lower alkyl

groups) or

and at least one of R₂ is not H, OCH₃, CH₃, or halogen
5 when the compound of Formula I is a 1,4-diazobenzene
compound;

each Q is independently selected from one of the
following structures, each of which contain a
carboxylic acid or an acid-like functionality:
10 IA, IB, IC, ID, IE, IF and IG, wherein
IA has the following structure:

wherein:

each of R₃, R₄, R₅, R₆, or R₇, independently is
defined the same as R₁ above and, wherein at least
one of R₃, R₄, R₅, R₆, or R₇, is a hydroxy,
sulphydryl, tetrazole, oxadiazole, NO₂, or carboxy
in both Q's, and wherein at least one of R₁, or R₂

-140-

is a halogen when the compound of Formula I is a 4,4'-diazobiphenyl compound;

IB has the following structure:

(IB)

5

or

wherein:

each of R₁₀, R₁₁, R₁₂, R₁₃, R₁₄, R₁₅, or R₁₆ independently is defined the same as R₁ above, and wherein at least one of R₁₀, R₁₁, R₁₂, R₁₃, R₁₄, R₁₅ or R₁₆ is a hydroxy, sulfhydryl, tetrazole, 10 oxadiazole, NO₂ or carboxy in both Q's, and wherein at least one of R₁, or R₂ is a halogen when the compound of Formula I is a 4,4'-diazobiphenyl compound;

15

IC has the following structure:

(IC)

-141-

wherein:

each of R_{17} , R_{18} , R_{19} , R_{20} , or R_{21} is defined the same as R_1 above;

ID has the following structure:

5

(ID)

wherein:

each of R_{22} , R_{23} , or R_{24} independently is defined the same as R_1 above

and

10

represents a heterocyclic ring of one of the six following formulas:

-142-

IE has the following structure:

wherein:

5 each of R₂₅, R₂₆, or R₂₇ independently is defined the same as R₁ above

and

represents a heterocyclic ring of one of the six following formulas:

-143-

IF has the following structure:

wherein:

5

exactly one of R₂₈, R₂₉, R₃₀, R₃₁ or R₃₂ is the

link defined for Formula I above and each other
 R₂₈, R₂₉, R₃₀, R₃₁ or R₃₂ independently is defined the
 same as R₁ above, and wherein at least one of R₂₈,
 R₂₉, R₃₀, R₃₁ or R₃₂ is a hydroxy, sulfhydryl,
 10 tetrazole, oxadiazole, NO₂ or carboxy in both Q's;

-144-

IG has the following structure:

(IG)

wherein:

5 exactly one of R_{33} , R_{34} , R_{35} , R_{36} , R_{37} , R_{38} , or R_{39} is
the $\text{Z} \bigcirc \text{Z}$ link defined for Formula I above and each
other R_{33} , R_{34} , R_{35} , R_{36} , R_{37} , R_{38} , or R_{39} , independently
is defined the same as R_1 above, and wherein at
least one of R_{33} , R_{34} , R_{35} , R_{36} , R_{37} , R_{38} , or R_{39} is a
10 hydroxy, sulfhydryl, tetrazole, oxadiazole, NO_2 or
carboxy in both Q's;

or wherein:

15 $\text{Z} \bigcirc \text{Z} \bigcirc \text{Q}$ is $\text{NR}'-\text{N}=\text{Q}$ (where R' represents H or a lower
alkyl group) and each $\text{Z} \bigcirc \text{Q}$ is independently selected
from one of the following structures:
IIA or IIB, wherein:

-145-

IIA has the following structure:

(IIA)

wherein:

each of R₄₀ - R₄₃, independently is H, F, Cl, Br, I,
 5 a lower alkyl group, (CH₂)_nOR' where n=1, 2, or 3,
 CF₃, CH₂-CH₂F, O-CH₂-CH₂F, CH₂-CH₂-CH₂F, O-CH₂-CH₂-
 CH₂F, CN, (C=O)-R', N(R')₂, NO₂, (C=O)N(R')₂
 O(CO)R', OR', SR', COOR', R_{ph}, CR'=CR'-R_{ph}, CR'₂-
 10 CR'₂-R_{ph} (where R_{ph} represents an unsubstituted or
 substituted phenyl group with the phenyl
 substituents being chosen from any of the non-
 phenyl substituents defined for R₁), a tri-alkyl
 tin, a tetrazole or oxadiazole of the form:

15 (wherein R' is H or a lower alkyl group).

IIB has the following structure:

-146-

(IIB)

wherein:

each of R_{48} and R_{49} , independently is a lower alkyl group, $(CH_2)_nOR'$ where $n=1, 2$, or 3 , CF_3 , CH_2-CH_2F ,
 5 $CH_2-CH_2-CH_2F$, CN , $(C=O)-R'$, NO_2 , $(C=O)N(R')_2$, $COOR'$, $(C=O)-(CH_2)_n-(C_6H_5)$ where $n=1, 2$, or 3 , R_{ph} ,
 $CR'=CR'-R_{ph}$, $CR'_2-CR'_2-R_{ph}$ (where R_{ph} represents an unsubstituted or substituted phenyl group with the phenyl substituents being chosen from any of the non-phenyl substituents defined for R_i), a
 10 tetrazole or oxadiazole of the form:

(wherein R' is H or a lower alkyl group),

wherein at least one of R_{48} or R_{49} , is $(C=O)-R'$, NO_2 ,
 15 $(C=O)N(R')_2$, $COOR'$, CN , or a tetrazole or oxadiazole of the form:

-147-

(wherein R' is H or a lower alkyl group) in both Q's.

16. The method of claim 15, wherein at least one of the substituents R₁-R₇ and R₁₀-R₄, is R_{ph}, CR'=CR'-R_{ph},
5 CR'₂-CR'₂-R_{ph}.

17. The method of claim 15 wherein each R₂ is CH,
when $\text{Z} \bigcirc \text{Z} \bigcirc \text{Q}$ is N=N-Q.

18. The method of claim 14, wherein said amyloidosis-associated condition is selected from the
10 group consisting of Alzheimer's Disease, Down's Syndrome, Type 2 diabetes mellitus, hereditary cerebral hemorrhage amyloidosis (Dutch), amyloid A (reactive), secondary amyloidosis, familial mediterranean fever, familial amyloid nephropathy with urticaria and 15 deafness (Muckle-wells Syndrome), amyloid lambda L-chain or amyloid kappa L-chain (idiopathic, myeloma or macroglobulinemia-associated) A beta 2M (chronic hemodialysis), ATTR (familial amyloid polyneuropathy (Portuguese, Japanese, Swedish)), familial amyloid 20 cardiomyopathy (Danish), isolated cardiac amyloid, systemic senile amyloidoses, AIAPP or amylin insulinoma, atrial natriuretic factor (isolated atrial amyloid), procalcitonin (medullary carcinoma of the thyroid), gelsolin (familial amyloidosis (Finnish)),

-148-

cystatin C (hereditary cerebral hemorrhage with amyloidosis (Icelandic)), AApo-A-I (familial amyloidotic polyneuropathy - Iowa), AApo-A-II (accelerated senescence in mice), fibrinogen-associated amyloid; and Asor or Pr P-27 (scrapie, Creutzfeld Jacob disease, Gertsmann-Straussler-Scheinker syndrome, bovine spongiform encephalitis) or in cases of persons who are homozygous for the apolipoprotein E4 allele, and the condition associated with homozygosity for the apolipoprotein E4 allele or Huntington's disease.

19. A pharmaceutical composition for the prevention of cell degeneration and toxicity associated with fibril formation in amyloidosis associated conditions comprising Chrysamine G and a pharmaceutically acceptable carrier.

20. A pharmaceutical composition for the prevention of cell degeneration and toxicity associated with fibril formation in amyloidosis-associated conditions comprising the compound of claim 1 or a salt thereof and a pharmaceutically acceptable carrier.

21. A method of detecting amyloid deposits in biopsy or post-mortem human or animal tissue comprising the steps of:

-149-

- (a) incubating formalin-fixed tissue with a solution of a compound of claim 1 or a salt thereof to form a labelled deposit and then,
- (b) detecting the labelled deposits.

5 22. The method of claim 21 wherein said solution is composed of 25-100% ethanol (the remainder being water) saturated with the compound of claim 1 or a salt thereof.

10 23. The method of claim 21 wherein detecting is effected by microscopic techniques selected from the group consisting of bright-field, fluorescence, laser-confocal, and cross-polarization microscopy.

15 24. A method of quantifying the amount of amyloid in biopsy or post-mortem tissue comprising the steps of:

- a) incubating a radiolabeled derivative of Chrysamine G with a homogenate of biopsy or post-mortem tissue,
- b) separating the tissue-bound from the tissue-unbound radiolabeled Chrysamine G derivative,
- c) quantifying the tissue-bound radiolabeled Chrysamine G derivative, and
- d) converting the units of tissue-bound radiolabeled Chrysamine G derivative to units of

-150-

micrograms of amyloid per 100 mg of tissue by comparison with a standard.

25. The method of claim 24, wherein said radiolabeled derivative of Chrysamine G is an amyloid binding compound of Formula I or a water soluble, non-toxic salt thereof:

(I)

wherein:

$\text{Z} \text{---} \text{Z} \text{---} \text{Q}$ is either $\text{N}=\text{N}-\text{Q}$, $\text{CR}'=\text{N}-\text{Q}$, $\text{N}=\text{CR}'-\text{Q}$, $\text{CR}'_2-\text{NR}'-\text{Q}$,

10 $\text{NR}'-\text{CR}'_2-\text{Q}$, $(\text{CO})-\text{NR}'-\text{Q}$, $\text{NR}'-(\text{CO})-\text{Q}$ or $\text{NR}'-\text{NR}'-\text{Q}$ (where R' represents H or a lower alkyl group);

X is $\text{C}(\text{R}'')_2$

(wherein R'' is each independently is H, F, Cl, Br,

I, a lower alkyl group, $(\text{CH}_2)_n\text{OR}'$ where $n=1, 2$, or

15 3, CF_3 , $\text{CH}_2-\text{CH}_2\text{F}$, $\text{O}-\text{CH}_2-\text{CH}_2\text{F}$, $\text{CH}_2-\text{CH}_2-\text{CH}_2\text{F}$, $\text{O}-\text{CH}_2-\text{CH}_2-$

CH_2F , CN, $(\text{C}=\text{O})-\text{R}'$, $\text{N}(\text{R}')_2$, NO_2 , $(\text{C}=\text{O})\text{N}(\text{R}')_2$,

$\text{O}(\text{CO})\text{R}'$, OR' , SR' , COOR' , R_{ph} , $\text{CR}'=\text{CR}'-\text{R}_{ph}$, CR'_2-

-151-

CR'₂-R_{ph} (where R_{ph} represents an unsubstituted or substituted phenyl group with the phenyl substituents being chosen from any of the non-phenyl substituents defined for R''), a tri-alkyl tin, a tetrazole or oxadiazole of the form:

wherein R' is H or a lower alkyl group)

or X is CR'=CR', N=N, C=O, O, NR' (where R' represents H or a lower alkyl group), S, or SO₂;

each R₁ and R₂ independently is H, F, Cl, Br, I, a lower alkyl group, (CH₂)_nOR' where n=1, 2, or 3, CF₃, CH₂-CH₂F, O-CH₂-CH₂F, CH₂-CH₂-CH₂F, O-CH₂-CH₂-CH₂F, CN, (C=O)-R', N(R')₂, NO₂, (C=O)N(R')₂, O(CO)R', OR', SR', COOR', a tri-alkyl tin, R_{ph}, CR'=CR'-R_{ph}, CR'₂-CR'R_{ph} (where R_{ph} represents an unsubstituted or substituted phenyl group with the phenyl substituents being chosen from any of the non-phenyl substituents defined for R₁ and R₂), a tetrazole or oxadiazole of the form:

-152-

(wherein R' is H or a lower alkyl group), or a triazene of the form:

(wherein R₈ and R₉ are lower alkyl

groups) or

5

and at least one of R₂ is not H, OCH₃, CH₃, or halogen when the compound of Formula I is a 1,4-diazobenzene compound;

each Q is independently selected from one of the
10 following structures, each of which contain a carboxylic acid or an acid-like functionality:
IA, IB, IC, ID, IE, IF and IG, wherein
IA has the following structure:

(IA)

15

wherein:

each of R₃, R₄, R₅, R₆, or R₇ independently is defined the same as R₁ above and, wherein at least

-153-

one of R₃, R₄, R₅, R₆, or R₇, is a hydroxy,
sulfhydryl, tetrazole, oxadiazole, NO₂, or carboxy
in both Q's, and wherein at least one of R₁, or R₂
is a halogen when the compound of Formula I is a
5 4,4'-diazobiphenyl compound;

IB has the following structure:

(IB)

wherein:

10 each of R₁₀, R₁₁, R₁₂, R₁₃, R₁₄, R₁₅, or R₁₆
independently is defined the same as R₁ above, and
wherein at least one of R₁₀, R₁₁, R₁₂, R₁₃, R₁₄, R₁₅ or
R₁₆ is a hydroxy, sulfhydryl, tetrazole,
oxadiazole, NO₂ or carboxy in both Q's, and wherein
15 at least one of R₁, or R₂ is a halogen when the
compound of Formula I is a 4,4'-diazobiphenyl
compound;

IC has the following structure:

-154-

wherein:

each of R₁₇, R₁₈, R₁₉, R₂₀, or R₂₁ is defined the same as R₁ above;

5 ID has the following structure:

wherein:

each of R₂₂, R₂₃, or R₂₄ independently is defined the same as R₁ above

10

and

represents a heterocyclic ring of one of the six following formulas:

-155-

IE has the following structure:

wherein:

5 each of R₂₅, R₂₆, or R₂₇ independently is defined the same as R₁ above

and

represents a heterocyclic ring of one of the six following formulas:

-156-

IF has the following structure:

wherein:

5 exactly one of R₂₈, R₂₉, R₃₀, R₃₁ or R₃₂ is the z

link defined for Formula I above and each other
 R₂₈, R₂₉, R₃₀, R₃₁ or R₃₂ independently is defined the
 same as R₁ above, and wherein at least one of R₂₈,
 R₂₉, R₃₀, R₃₁ or R₃₂ is a hydroxy, sulfhydryl,
 10 tetrazole, oxadiazole, NO₂ or carboxy in both Q's;

-157-

IG has the following structure:

(IG)

wherein:

5 exactly one of R₃₃, R₃₄, R₃₅, R₃₆, R₃₇, R₃₈, or R₃₉ is
the $\text{Z} \bigcirc \text{Z}$ link defined for Formula I above and each
other R₃₃, R₃₄, R₃₅, R₃₆, R₃₇, R₃₈, or R₃₉ independently
is defined the same as R₁ above, and wherein at
least one of R₃₃, R₃₄, R₃₅, R₃₆, R₃₇, R₃₈, or R₃₉ is a
10 hydroxy, sulphydryl, tetrazole, oxadiazole, NO₂ or
carboxy in both Q's;

or wherein:

$\text{Z} \bigcirc \text{Z} \bigcirc \text{Q}$ is NR'-N=Q (where R' represents H or a lower
alkyl group) and each $\text{Z} \bigcirc \text{Q}$ is independently selected
15 from one of the following structures:
IIA or IIB, wherein:

-158-

IIA has the following structure:

(IIA)

wherein:

each of R₄₀ - R₄₃, independently is H, F, Cl, Br, I,
5 a lower alkyl group, (CH₂)_nOR' where n=1, 2, or 3,
CF₃, CH₂-CH₂F, O-CH₂-CH₂F, CH₂-CH₂-CH₂F, O-CH₂-CH₂-
CH₂F, CN, (C=O)-R', N(R')₂, NO₂, (C=O)N(R')₂,
O(CO)R', OR', SR', COOR', R_{ph}, CR'=CR'-R_{ph}, CR'₂-
10 CR'₂-R_{ph} (where R_{ph} represents an unsubstituted or
substituted phenyl group with the phenyl
substituents being chosen from any of the non-
phenyl substituents defined for R₁), a tri-alkyl
tin, a tetrazole or oxadiazole of the form:

15 (wherein R' is H or a lower alkyl group).

IIB has the following structure:

-159-

(IIB)

wherein:

each of R_{48} and R_{49} , independently is a lower alkyl group, $(\text{CH}_2)_n\text{OR}'$ where $n=1$, 2, or 3, CF_3 , $\text{CH}_2\text{-CH}_2\text{F}$,
 5 $\text{CH}_2\text{-CH}_2\text{-CH}_2\text{F}$, CN , $(\text{C=O})\text{-R}'$, NO_2 , $(\text{C=O})\text{N}(\text{R}')_2$,
 COOR' , $(\text{C=O})\text{-}(\text{CH}_2)_n\text{-}(\text{C}_6\text{H}_5)$ where $n=1$, 2, or 3, R_{ph} ,
 10 $\text{CR}'=\text{CR}'-\text{R}_{\text{ph}}$, $\text{CR}'_2\text{-CR}'_2\text{-R}_{\text{ph}}$ (where R_{ph} represents an unsubstituted or substituted phenyl group with the phenyl substituents being chosen from any of the non-phenyl substituents defined for R_1), a
 tetrazole or oxadiazole of the form:

(wherein R' is H or a lower alkyl group),

wherein at least one of R_{48} or R_{49} , is $(\text{C=O})\text{-R}'$, NO_2 ,
 15 $(\text{C=O})\text{N}(\text{R}')_2$, COOR' , CN , or a tetrazole or oxadiazole of the form:

-160-

(wherein R' is H or a lower alkyl group) in both Q's.

26. The method of claim 25, wherein at least one of the substituents R₁-R, and R₁₀-R₄, is selected from 5 the group consisting of R_{ph}, CR'=CR'-R_{ph}, CR',₂-CR',₂-R_{ph} (where R_{ph} represents an unsubstituted or substituted phenyl group with the phenyl substituents being chosen from any of the non-phenyl substituents defined for R₁).

10 27. The method of claim 25 wherein at least one of the substituents R₁-R, and R₁₀-R₄, is labeled with a radiolabel selected from the group consisting of ¹²⁵I, ³H, and a carbon-containing substituent as specified in Formula I, wherein at least one carbon is ¹⁴C.

15 28. A method for synthesizing a biphenyl compound of claim 1, wherein R₂ is ³H, comprising performing a reaction of 3,3'--[³H]benzidine with a selected coupling component to yield the compound of claim 1.

29. A method of distinguishing an Alzheimer's 20 disease brain from a normal brain, comprising:

a) separately incubating a homogenate of weighed tissue from each of (i) the cerebellum and (ii) another area of the same brain other than the cerebellum, from a subject suspected of having Alzheimer's disease, with

-161-

a radiolabeled Chrysamine G derivative so that amyloid in each said tissue homogenate binds with said radiolabeled Chrysamine G derivative;

5 b) quantifying the amount of amyloid bound to said radiolabeled Chrysamine G derivative by;

b1) separating the tissue-bound from the tissue-unbound radiolabeled Chrysamine G derivative,

b2) quantifying the tissue-bound radiolabeled Chrysamine G derivative, and

10 b3) converting the units of tissue-bound radiolabeled Chrysamine G derivative to units of micrograms of amyloid per 100 mg of tissue by comparison with a standard,

c) calculating the ratio of the amount of amyloid in the area of the brain other than the cerebellum to the amount of amyloid in the cerebellum;

15 d) comparing the ratio of the amount of amyloid in tissue from the subject suspected of having Alzheimer's disease with ratios for the amount of amyloid in said tissue from normal subjects; and

20 e) determining the presence of Alzheimer's disease if said ratio from the brain of a subject suspected of having Alzheimer's disease is above 90% of the ratio obtained from the brains of normal subjects.

25 30. The compound of claim 1, wherein the acid-like functionality is provided by a functional group

-162-

which contains an ionizable proton with a pK_a of less than 10.

31. The method of claim 15, wherein the acid-like functionality is provided by a functional group which 5 contains an ionizable proton with a pK_a of less than 10.

32. The method of claim 25, wherein the acid-like functionality is provided by a functional group which contains an ionizable proton with a pK_a of less than 10. 10.

33. A method according to claim 28, wherein the reaction is selected from the group consisting of azo coupling, amide coupling, or Schiff base formation, and wherein the selected coupling component is selected 15 from the group consisting of a salicylic acid derivative, or a naphthoic acid derivative.

SALICYLIC ACID DERIVATIVE.

FIG. 2B

CHRYSAMINE G WITH
GENERAL TRI-ALKYL TIN.

FIG. 2C

3-HYDROXY-1,2-BENZISOXAZOLE DERIVATIVE.

FIG. 2D

PHTHALIMIDE OR
ISOINDOLE-1,3(2H)-DIONE.

FIG. 2E

PHTHALHYDRAZIDE OR 2,3
BENZODIAZINE-1,4
(2H,3H)-DIONE DERIV.

FIG. 2F

BENZOXAZINE-1,4(3H)-
DIONE DERIVATIVE.

FIG. 2G

(2H)1,3-BENZOXAZINE-2,4(3H)-
DIONE DERIVATIVE.

FIG. 2H

(3H)-2-BENZAZINE-1,3(2H)-
DIONE DERIVATIVE.

FIG. 2I

1,8-NAPHTHALIMIDE
DERIVATIVE

FIG. 2J

TETRAZOLE DERIVATIVE.

FIG. 2K

Oxadiazole DERIVATIVE.
